

## TRS-80*Model I Computer Owners

## Store More Data on a $5^{\prime \prime}$.Disk Than on an 8"•Disk

The Doubler ${ }^{\text {™ }}$ : Percom's new proprietary double-density adapter for the TRS-80* computer.

Plug the DOUBLER ${ }^{T M}$ into the disk controller chip socket of your Expansion Interface and...

## Store up to 354 Kbytes of formatted data on five-inch disks.

- Increase formatted storage capacity of your minidiskettes from $11 / 2$ to almost 4 times.
- Use with standard 5 -inch drives rated for double-density operation. - The DOUBLER ${ }^{\text {tu }}$ reads, writes and formats either single- or doubledensity disks.
- Proprietary design allows you to continue to run TRSDOS*, NEWDOS $\ddagger$, Percom OS- $80^{\text {th }}$ or other single-density software without making any changes to software or hardware.

Mini-Disk Systems More storage capacity, higher reliability - from Percom, the industry leader. One-, twoand three-drive configurations in either 40- or 77 -track format, starting at only $\$ 399$.

- Includes DBLDOS, ${ }^{\text {4 }}$ a TRSDOS* compatible doubledensity disk operating system.
- CONVERT utility, on DBLDOS ${ }^{\text {4 }}$ minidiskette, converts files and programs from single- to double-density or double- to single-density.
- Plug-in installation: No strapping. No trace cutting. Restore your Expansion Interface disk controller to original configuration by simply removing the DOUBLER ${ }^{\text {™ }}$ and reinstalling the original disk controller chip.

> COUPON worth $\$ 20$ toward The Purchase of a DOUBLER ${ }^{\text {4 }}$
> Coupon No. 80M103
> Expires December 30, 1980
> Void where prohibited by law.

- The DOUBLER ${ }^{\text {™ }}$ circuit card includes high-performance data separator, write precompensation circuits for reliable disk read operations - even on 77-track drives.

Introductory price, including DBLDOS $^{\text {TM }}$ and format conversion utility on minidiskette, only $\$ 219.95$. Use the coupon for even greater savings.
Call toll-free, 1-800-527-1592, for the address of your nearest dealer, or to order direct from Percom.

PERCOM DATA COMPANY, INC. 211 N. KIRBY GARLAND, TEXAS 75042 (214) 272-3421

## The easiest, least expensive way to generate spectacular multi-color graphics, sharp two-color alphanumerics: Your computer, a color tv set and the Percom Electric CrayonT.

Add the Electric Crayon ${ }^{\text {TM }}$ to your system and your keyboard becomes a palette, the tv screen your medium.
You dab and stroke using onekey commands to create dazzling full-color drawings, eye-catching charts and diagrams.

Or you run any of innumerable programs. Your own BASIC language programs that generate dynamic pyrotechnic images, laugh-provoking animations.

From a combined alphanu-merics-semigraphics mode to a high resolution 256- by 192 element full graphics mode, the microprocessor-controlled Electric Crayon ${ }^{\text {TM }}$ is capable of generating 10 distinctly different display modes.

Colors are brilliant and true, and up to eight are available depending on the mode.
As shipped, the Electric Crayon'" interfaces a TRS-80* computer via your Expansion Interface or Printer

Adapter. It may be easily adapted for interfacing to any computer or to an ordinary parallel ASCll keyboard.

But that's not all
The Electric Crayon is not just a color graphics generator/controller.

It is also a complete selfcontained control computer. With built-in provision for 1 K -byte of on-board program RAM, an EPROM chip for extending EGOS ${ }^{\text {TM }}$, its on-board ROM graphics OS, and a dual bidirectional eight-bit port - over and above the computer/keyboard port - for peripherals. The applications are endless.
Shipped with EGOSTM, 1K-byte of display memory and a comprehensive user's manual that includes an assembly language listing of $\mathrm{EGOS}^{\text {m }}$ and listings of BASIC demo programs, the Electric Crayon ${ }^{\text {TM }}$ costs only $\$ 249.95$.

Options include:

- LEVEL II BASIC color graphics programs on minidiskette: $\$ 17.95$.
- A 34-conductor ribbon cable to interconnect the Electric CrayonTM to a TRS-80*: \$24.95.
- RAM chips for adding refresh memory for higher density graphics modes: $\$ 29.95$ per K-byte.
- Electric Crayontm Sketchpad, a sketching grid of proportioned picture elements (pixels) in a tv aspect ratio. For $128 \times 192$ or $256 \times$ 192 graphics modes. 11 -inch by 17 -inch, 25 -sheet pads: $\$ 3.95$ per pad
SYSTEM REQUIREMENTS: the video circuitry of the Electric Crayon ${ }^{\text {TM }}$ provides direct drive input to a video monitor or modified tv set. An internal up-modulator for it antenna input may be constructed by adding inexpensive components to the existing video circuitry.
Prices and specifications subject to change without notice
toll-free, 1-800-67-1882, for the address of your nearest dealer, or to order direct if there is no Percom dealer in your area.

# META TECHNOLOGIES FOR YOUR TRS-80 ${ }^{\circ}$ DISK SYSTEM 

## PROGRAMMING TOOLS

## - $A V E \quad \begin{array}{r}\text { Any 3, } \\ \$ 4995\end{array}$

For Model II
\$ 74.95
\$19.95
\$29.95
For Model il Includes MTC QUE Card!
Having trouble with RANDOM FILES? With MTC's Table-Driven Access Method (TTAM) you'll never tret over FIELDing again. No knowledge of random access files is required. Insert the TDAM "interpreter" into any BASIC program and type in a few DATA statements describing the information in your files. TDAM does the rest! Reads and writes fields and records of any type (even compresses a DATE field into 3 bytes!). Features automatic file buffer allocation/deallocation. memory buffering, sub-record blocking/deblocking, and handies up to 255 fields per record. Super fast and super simple! Complete with TDAM interpreter, instructions and demo program. Requires programming experience.

## DIVERGE

\$19.95
For Model II
\$29.95
Compares two BASIC program files, showing the differences between them. Identifies \& lists lines which have been inserted, deleted, \& replaced. Use for version control.

## REBUILD <br> $\$ 19.95$ <br> For Model II <br> \$29.95

Reorganize programs for adding program code, faster execution, readability. Much more than simple renumbering. Rearrange groups of statements within a program automatically updates references to line numbers. Use with SUPERSEDE and MINGLE for maximum effect

Complete for Model I with all utilities
Plus exclusive MTC QUE card!
40 TRACK VERSION
. . . . . . . . \$ 79.95 includes REF, RENUM, SUPERZAP, EDITOR/ ASSEM., DISASSEM., DIRCHECK, and more! This is the original NEWDOS with all of Apparat's utility programs. Includes exclusive MTC QUE (Quick User Education) card.
MTC QUE Card only
.$\$ 1.50$

SIFTER. . . . . . . . . . . . . . . . . . $\$ 19.95$
For Model il. . . . . . . . . . 29.95
Twelve in-memory high-speed sorts for use in any BASIC program: stable, non-stable, with/without tags, for numeric or string data. Random File Sort included. Some sorts written in machine code. Includes sort subroutines. demo programs and instructions. Relocate as needed with REBUILD. Requires programming experience.
SHRINK
. $\$ 19.95$
For Model II.
II. . .
$\$ 29.95$

Makes Every Byte Count! Make programs smaller and faster! Combines lines \& removes unnecessary code including remarks, without altering program operation. Typically reduces program size $25 \%$ to $40 \%$.

## SUPERSEDE <br> $\$ 19.95$ <br> For Model II. <br> ers.... \$29.95

 or the serious amateur. Probably one of the greatest time-savers available. Write programs in shorthand. change variable names. generate program documentation - use with REBUILD and MINGLE to build new programs from old ones.
## MINGLE-II. <br> For Model II <br> $\$ 19.95$

Merge up to 14 tiles 1 Proram or singe up to 14 files (Program or Data) into a single file. Data files may be merged in ascending or descending sequence with the ordering based on a user-specified comparison field. A very handy utility for consolidating data files.

The perfect supplement for your NEWDOS, from IJG, Inc.

## "TRS-80 DISK AND OTHER MYSTERIES"

by Harvard C. Pennington
132 pages written in PLAIN ENGLISH packed with HOW TO information with details, examples and indepth explanations. Recover lost files and directories, remove file protection, make BASIC programs unlistable. How to use SUPERZAP, recover from DOS errors and MORE!

## NEWDOS/80 <br> by Apparat

Apparat's long awaited successor to NEWDOS + is here! This is not an enhanced version of NEWDOS, but a completely new product. Simplified DOS commands can be instantly executed from BASIC, even within a program. without disturbing the resident code. System options, such as password protection, number and type of disk drives, BREAK key enable/disable and lowercase modification recognition, can be quickly and easily changed. Five new randomaccess file types allow record lengths of up to 4096 bytes, and no FIELDing! A powerful CHAIN facility allows keyboard INPUTs to be read from a disk file. An improved RENUMBER facility permits groups of statements to be relocated within program code. Diskettes may even be designated as RUN.ONLY! Features all NEWDOS+ utilities (SUPERZAP 3.0, etc.) and much more! One MTC technical staff member said having NEWDOS $/ 80$ is "better than sex" (you'll have to judge for yourself!). Includes 180-page instruction manual and MTC QUE card.
NEWDOS/80.

# META TECHNOLOGIES 

## MTC AIDS-III*

## MODELI... $\$ 69.95$ <br> MODEL II . <br> $\$ 99.95$

Introducing the latest addition to MTC's family of data management systems, AIDS-III. NO PROGRAMMING, easy to use. COMPLETE PACKAGE including demonstration application, documentation and MAPS-III (see below).

- Up to 20 USER-DEFINED FIELDS of either numeric or character-type.
- CHARACTER-type fields may be any length (total: up to 254 characters)
- NUMERIC-type fields feature automatic formatting, rounding, decimal alignment and validation.
- Full feature EDITING when adding or changing records

ENTER FIELD (can't type-in more characters than specified).

BACKSPACE (delete last character typed)
DELETE FIELD contents
RESTORE FIELD contents

RIGHT. JUSTIFY FIELD contents.
SKIP FIELD (to next or previous field).
SKIP RECORD (to next or previous record)

- SORTING of records is MACHINE CODE assisted. 200 RECORDS ( 40 characters) in about 5 SECONDS
ANY COMBINATION of fields (including numerics) with each field in ascending or descending order
- SELECTION of records for Loading. Updating. Deleting. Printing and Saving is MACHINE CODE assisted

Specify up to 4 CRITERIA, each using one of 6 RELATIONAL COMPARISONS LOAD or SAVE selected records using MULTIPLE FILES
Example: Select records representing those people who live in the state of Colorado, but not in the city of Denver, whose last names begin with " F and whose incomes exceed $\$ 9000.00$
Example: Select records representing those sales made to XYZ COMPANY that exceed $\$ 25.00$, between the dates $03 / 15$ and $04 / 10$

MAPS-III (MTC AIDS PRINT SUBSYSTEM), included at no charge, has the following features

- Full AIDS-III SELECTION capabilities.
- Prints user-specified fields DOWN THE PAGE
- Prints user-specified fields in titled, columnar REPORT FORMAT, automatically generating column headings, paging and (optionally) indentation.
- Can create a single report from MULTIPLE FILES
- Prints user-defined formats for CUSTOM LABELS, custom forms, etc

BELOW ARE TESTIMONIALS from owners of AIDS systems. These are absolutely authentic statements and are typical of the comments we receive
"This program will do more for my business than all the other programs I have, combined.'

David Wareham, Vice President (EDP), National Hospital and Health Care Services Inc.
'We have 32 different Data Base Management packages for the TRS-80. AIDS-III is easily the best. It also makes it easier for us to step up to our Model II since the package is available for both computers."

Jack Bilinski, President, 80 Microcomputer Services
"Your AIDS program is far and away the finest information management system that I've ever seen. I am currently using it to maintain a clear picture of the demographic data on all the kids in our residential treatment program and it is working for me superbly.

Frank Boehm, Director, Front Door Residential Treatment Program

- COMPATIBLE with AIDS-II data files and AIDS subsystems
- Move up from AIDS-II and EXPAND to 20 field capability WITHOUT REENTERING DATA.
- AIDS-II (Model I or II) owners may UPGRADE FOR ONLY $\$ 25.00$.
*WARNING! This program is written in BASIC and can be listed in the normal manner Modification of program code is NOT RECOMMENDED due to its extreme complexity

Let your TRS-80 ${ }^{\circ}$ Teach You
ASSEMBLY LANGUAGE
REMSOFT's unique package. "INTRODUCTION TO TRS-80 ASSEMBLY PROGRAMMING" includes ten 45 -minute lessons on audio cassettes, a display program for each lesson providing illustration \& reinforcement, and a text book on TRS-80
Assembly Language Programming. Includes useful routines to access keyboard, video, printer and ROM. Requires 16 K - Level II, Model I.
REMASSEM-1
$\$ 69.95$

## MTC AIDS - II

Ailing information? Doctor it up with AIDS-II. This Automated Information Directory System offers twelve user-defined fields with full feature editing when adding or changing records. Selec tive Loading, Updating, Deleting, Printing and Saving records may be accomplished using any of six relational comparisons. Also features machine code assisted sorting ( 200 records in about 5 seconds) by any combination of fields, and much more! Unique "windowing" capability allows directories of unlimited size. Window size is typically 200 or more records in 32K. Can be used for mailing lists, client reference reporting appointment "calendars", inventory records and other information systems. Easy to use. Defining a system takes about a minute. MAPS-I (MTC AIDS PRINT SUBSYSTEM) is included at no charge. MAPS features full AIDS-II selection capabilities, prints user-specified fields down the page, produces user-specified columnar report formats with automatically generated column headings and paging, and allows user-defined print formats for custom forms, labels, etc. Add subsystems for additional capabilities. May be upgraded to AIDS-III when required.
MTC AIDS-II
$\$ 49.95$
For Model II
\$79.95

## AND OTHER MYSTERIES

Volume II<br>Forward by H. C. Pennington

Call now and place your order for his new book. MICROSOFTTM BASIC AND OTHER MYSTERIES" A primer for cassette and disk BASIC on the TRS-80, the information provided applies to similar MICROSOFTTM BASIC interpreters. Features include definition of terms, an overview of BASIC and DOS, explanation of exits, error codes, verb actions, "cold" and "warm" restart procedures, and examination of system utifities, arithmetic support and WO driver routines, and the communications region in RAM. Individual routines are explained in detail, with an index provided for easy access. Appendixes include tables for BASIC and DOS, vectors, stacks and interrupt locations, PLUS thousands of comment lines for the complete MICROSOFTTM BASIC. Available from the publisher in just a few short weeks, the price is less than $\$ 30$.

## $\longleftarrow$ MORE <br> PRODUCTS ON PAGE 4

## Let Your TRS-80 ${ }^{\text {² }}$ Teach You ASSEMBLY LANGUAGE DISK I/O TECHNIQUES

REMSOFT does it again! REMDISK-1 is a concise, capsulated supplement to REMASSEM-1. Package consists of two 45 -minute lessons on audio cassettes, and display programs providing illustration and reinforcement. Provides specific track and sector I/O techniques, and sequential and random file access methods and routines.

REMDISK-1
$\$ 29.95$

## Let Your TRS-80 Test Itself With <br> THE FLOPPY DOCTOR \& MEMORY DIAGNOSTIC by THE MICRO CLINIC

A complete checkup for your Model I. THE FLOPPY DOCTOR completely checks every sector of 35 - or 40 -track disk drives. Tests motor speed, head positioning, controller functions, status bits and provides complete error logging. THE MEMORY DIAGNOSTIC checks for proper write/read, refresh, executability and exclusivity of all address locations. Includes both diagnostics and complete instruction manual.
SYSTEM DIAGNOSTICS
\$19.95

# MAKES EVERY BYTE COUNT 

IN YOUR TRS-80 ${ }^{\circ}$ MODEL I OR MODEL II DISK SYSTEM

## MTC AIDS CALCULATION SUBSYSTEM-III MODEL I . . . $\$ 24.95$ MODEL II... $\$ 39.95$

Compare AIDS-III/CALCS with any other data management package under $\$ 100$ !
Others make claims, CALCS-III delivers with user-specified:

- Fields in any order, with optional indentation
- Columnar subtotals and totals
- Computations using field values and constants Use for accounting, inventory, financial and other numeric-based information packages.

## CALCS-III REQUIRES THE PURCHASE OF AIDS-III OR AIDS-II

# "I can't really be critical of Radio Shack for being slow in keeping up with the pioneers of new hardware and improvements on their software." 

## What About Tandy?

You'll find me being critical of Radio Shack where I feel that they can improve their act. I think you'll find me properly appreciative when they do come up with improvements and, hopefully, tolerant when I can see that things are beyond their control.
For instance, I can't really be critical of Radio Shack for being slow in keeping up with the pioneers of new hardware and improvements on their software. Since I am fighting a similar battle against time with Instant Software, I realize how long it takes to implement something new, particularly when your reputation is at stake. It's easy to rush a new program out to the market as long as you don't care whether it has bugs or not, or whether it is the best one out of its type. This is why so many of the smaller program houses have such a high percentage of crap. Tandy can't afford that any more than Instant Software. Innovation takes an exasperatingly long time, and we live with it, though not graciously.
Recognizing that I tend to hear the horror stories, I'd like to hear from any programmers who have had a happy relationship with Radio Shack. Before 1 go warning programmers to be extra careful, I'd like to make sure that I have the facts. Billion dollar firms are difficult to deal with and can inadvertently squash individuals without being aware of it. The higher ups
are protected from the flak by armies of lower echelon people, who do not want to "bother" the bosses.

## Change in Strategy

When 80 was started, I planned to keep the higher level TRS-80 articles in Kilobaud Microcomputing as a sort of "next step upwards" for computerists. Since that time, the market has changed and the magazines must change with it. $K M$ has gained a wider business and education-oriented readership.

There are still hobbyists, but they are quite a different breed, for the most part, from the computer hobbyists of five years ago. I suspect that most of the circa 1975 hobbyists have either quit in disgust over the problems they encountered or else are alive and well, but working in the industry. The new hobbyists are less interested in designing circuits than in writing programs and finding out better ways to use microcomputers. They have become trapped by the enjoyment and mental expansion which computers bring. They are the new "hobbyists."

In line with this concept it seems appropriate to let 80 cover the world of the TRS-80 and KM the rest of the systems-all at a fundamental level that can help newcomers learn about computing.
In line with this basic concept we are looking for articles which will help newcomers over the hurdles. If you are a rank beginner, you might
keep a log of the things that perplex you and then, when you have surmounted these problems, take the time to offer help to those who are to come after you.

Beginners need articles that explain in English about all of the mysteries of computers. They want to know about all the different kinds of printers and which they need to buy. They want to know about memory and storage devices. I have yet to see a good article anywhere on all of the different kinds of disk units. They want to know about I/O ports, about control systems, about languages and operating systems. They want up-to-date information. Get busy. We pay well for articles.

## The Future

How can one look very far into the future of computers? The changes are coming on a monthly basis. It is almost all we can do to cope with the present, much less predict with success what things will be like in five, ten or twenty years.
Yet, when we look back on the past, we find that most of the things we have at present were reasonably predictable.
Microcomputers can save a whale of a lot of money and time (which is money) for businesses, so in the future, we are going to see them being used heavily. One of the more significant developments will be a universal electronic mail system. Once that is up and running I think micros will be getting into businesses at

Lew Kornfeld, the president of Radio Shack, attended the showing of the three new TRS-80 computer systems at the recent press conference in Ft. Worth. That's Lew on the left, me on the right.

The Model III was a good move, if not particularly newsworthy in view of the small changes between it and the Model I. It does pave a way toward eventually stopping production on the Model I, which FCC noise requirements would have dictated anyway.

# Very sharp printout at very low payout 

 ${ }^{\text {s }} 595{ }^{*}$

## The Heath H-14 Printer gives you high-performance features at one of the lowest prices anywhere...

- $5 \times 7$ dot matrix and high quality impact printhead give you clear, easy-to-read images
- Standard 96-character ASCII set, UPPER and lower case
- Operator or software-selectable line widths; 132, 96, or 80 characters
- Compatibility with any computer having RS-232C or 20 mA current loop serial interface, with handshaking
- Sprocket paper feed, with adjustable spacing, to keep paper moving smoothly
- Sustainable print speed approximately 30 characters per second
- "Paper jammed" and "paper out" signals to prevent loss of data
- Selectable baud rates from 110 to 4800
- Convenience of standard fan-fold paper, 2.5 to 9.5 inches wide
- Chrome wire rack to keep paper neat

## Visit your Heathkit Service Center

H-14 Printers are on display at the 61 Heathkit Electronic Centers throughout the U.S. and Canada. See your telephone white pages for the location mearest you.
In the U.S. Heathkit Electronic Centers are units of Veritechnology Electronics Corporation.
*In kit form, FOB Benton Harbor, MI. Also available completely assembled at $\$ 895.00$, FOB Benton Harbor: Prices subject to change without notice.

The H-14's remarkable price includes connecting cables, paper rack, paper, and ribbon - so you're all ready to run. And service for the $\mathrm{H}-14$ is available at 61 Heathkit Electronic Centers in the U.S. or Canada.
Check out the microprocessor-based H-14 Printer today, in kit form or factory assembled. You'll find complete details in the newest, FREE Heathkit Catalog. Send for yours today, or pick one up at the nearest Heathkit Electronic Center. Dealer inquiries on assembled units are invited, too.
Complete service, so you're
never left out in the cold

a much faster clip than they are at present. That use alone will more than pay for the computer.

The software business will, I expect, grow significantly for specific business uses. I'm still not wholly convinced of the place of the computer in the home, or even of the concept of the personal computer. I suspect that the media have been led astray by these terms.

The more I think about home applications for the computer, the more convinced I am that most of these applications will be taken over by dedicated microprocessors. Sure, we can run a microwave oven with our home computer, but with a lot less trouble we can build a chip into the oven to do the job. Ditto watering the lawn, security for the home, and ditto, I'm afraid, for almost every other application which comes to mind for the home. Sorry about that, home computerists.

As more and more of us work at home or use a computer for educational purposes at home, perhaps the home computer will come into its own. I don't think it will be much different from a school computer or an office computer. Oh , an automated index to our records and books would be handy...if we want to spend the time it takes to input all that data and keep it up to date. The idea is boggling to me since I have, perhaps, 5,000 books to index and, perhaps, a thousand records with God knows how many cuts on them. Then there are all those magazine articles I would like to be able to find. It comes down to whether or not I can afford a full-time secretary to put all that data into the computer so I can find the record or book I want. I can do that pretty well now, without the index-if I spend a bit of time searching. That may be more efficient than the index.

What do you think?

## Threats from Japan

Virtually every Japanese electronics firm has had a microcomputer on the market. It was only a matter of time before some of these outfits started looking to see what they could do over here. One of the first units to come over was the Sord, but it was a quarter-hearted effort and unsupported by significant advertising, so nothing came of it.

At NCC in May I saw the first of NEC systems being shown. I am not yet sure that Nippon Electric will be coming over in force, but their success in Japan and their competitive edge against Apple may turn the trick.

More definite are the plans by Matsushita with their Panasonic and Quasar brand consumer electronics. They showed their Quasar system at the summer CES (June) in Chicago and generated much enthusiasm. I talked with them about this and they are projecting sales of about one million systems for 1981. At approximately $\$ 400$, the computer is not much larger than those language translators, a hand-held unit. Even with all of its accessories, it will fit in a small attache case. It's ideal for the traveling businessman or salesman. They just might reach their goal in 1981, unless Radio Shack pushes hard with their very similar TRS-80 Pocket Computer.

Another interesting system shown at CES
was from Casio. Casio says they intend to be the largest microcomputer firm in the U.S. by 1982. With enough software support and the well-known Casio advertising and marketing, they might do it.

Apple? Their sales are growing rapidly, but limited available software could be their Achilles' heel. The Apple may take a licking with competition from the NEC and new TRS-80 Color equipment, particularly if NEC makes a strong move to get software support for their system.

## New Hardware

Tandy's Model III is a nice development, as is the TRS-80 Pocket Computer, but perhaps Radio Shack is reacting too much to the hardware competition and further splintering their ability to support their systems with software.

I remember the panic which came over Mits when they saw Sphere coming out with a 6800 based computer. Instead of pushing ahead hard with their 8080 based system and developing further hardware and software support for that, they squandered their lead by trying to quickly compete with the Sphere system introducing their own 6800 computer. The result was a multimillion-dollar disaster. I suspect their pushing the 6800 was the downfall of Mits, weakening their cash situation, curtailing their growth, and eventually forcing them to sell out to Pertec, where massive indifference to
the micro market quickly sank whatever was left of Mits.

If Mits had pushed their advantage and not gone into a panic mode over the Sphere, which folded up as a result of poor design, an almost total lack of software support and insufficient financing, Mits might be one of the largest firms in the field today. Millions of dollars down the tubes.

I can understand the worry by Radio Shack over the Quasar and Panasonic pocket computers and it may turn out that the effort required to turn out Radio Shack's own system was well invested. But with six different computer models to support, even the resources of a billion dollar firm are straining beyond what seems practical

The TRS-80 color unit looks good in response to the growing market share being taken by Apple.

The Model III TRS-80 is an appropriate response to the need of businesses and schools for more self-contained units and to the recent increase in Commodore sales resulting from their single unit system design. The software compatibility with earlier TRS-80 systems is a big plus and, I suspect, that the design considerations were not a big deal for Tandy. Model III is more a repackaging project, a successful one, 1 would say.

Come 1983, which manufacturer will be in the driver's seat?

## INSIDE 80 <br> by Ed Juge, director of

computer merchandising, Tandy Radio Shack

Last month space did not permit telling you dabout our new printers in the Radio Shack line for 1981. Introduced at the same time as our new computers, they have been quite well received. I'd like to tell you about two of them now.

The first is our new TRS-80 Line Printer VI available September 30 . It is a very low-profile, 14 -inch wide, 132 -column printer, which can be pinch-fed, but comes with a removable, adjustable tractor feed. It has a nine-wire dot-matrix head, and produces four print sizes $(5,7.5,10$, or 15 -characters-per-inch), plus graphics characters. Of course it offers upper and lowercase. Its speed is 100 CPS , and the LP VI is bidirectional. The average throughput is 33 -lines-per-minute and it uses our standard parallel port interface.

## Versatile Feed

The versatile feed system allows you to use tractor-fed forms from four to $14-7 / 8$-inches wide, or even single sheets of paper (pinchfeed). It's also rated for the original and two copies. Its overall size is only $61 / 3 \times 131 / 3$ inches, and it weighs only 28 pounds. Exclusive of the cable, it's only $\$ 1,160$.

The other new printer is our TRS-80 Plotter/

Printer, scheduled in limited quantities, for the end of November. If your primary requirement is plotting, but you don't want to buy a separate printer to list your programs, this might just handle both of your needs. This unique intelligent plotter draws with a standard ballpoint pen, on a continous roll of pin-fed, 9 -inch wide paper. It can handle complex plots and graphs with outstanding resolution, and it can print upper and lowercase letters, approximately nine per inch, or 75 per line, at a nominal five-lines-per-minute.

The TRS-80 Plotter/Printer uses our parallel interface, weighs in at 26 pounds, and is $71 / 2 \times$ $183 / 4 \times 14-4 / 5$ inches. The price, excluding cable is $\$ 1,460$.

This might be a good time to publicly reply to a fairly common question. . and, 1 admit, some complaints. The complaints seem to revolve around a customer who bought a TRS-80 and Scripsit, but wanted someone else's printer. Now he can't get them to work together properly. Nor can he get anybody at Radio Shack to tell him how to make them work. work.

Well, I can certainly sympathize. At one time, I did a bit of drooling over one of the nonRadio Shack word processing printers. I was Inside to page 40

## 80 input

# "The next time you. . . use the VTR to record that great movie from TV... label yourself. . . a thief, or worse, a pirate." 

Computronics' Rebuttal

I wish to take issue with the statement made by Peter J. Brennan on Page 11 of the July, 1980 issue of 80 Microcomputing. In that issue, Mr . Brennan states tht Computronics is "too expensive." I wish to point out some benefits one receives when subscribing to the $H \& E$ Computronics Newsmagazine for $\$ 24$ per year.

1. Twelve monthly issues of the magazine are devoted largely to the serious TRS-80 owners rather than the hobbyist.
2. A 48 -page catalog containing 180 software items written by established houses.
3. A money-back guarantee on all the software we sell (and even a money-back guarantee on disk drives and printers).
4. A free cassette containing five programs.
5. We have a special help line, and in-house programmers who will answer any question related to the TRS-80, including questions about hardware or software, wherever purchased.

In closing I wish to quote a part of a letter that we published in our magazine.
". . I very much appreciate your software refund policy. I was astonished at the speed with which you refunded me the price of the Income Tax Pax B program that I found not very useful at all. You may be sure that when I buy software in the future, you will be my first source. I don't want to return it . . I want it to work right. . . but it's nice to know I am not stuck with useless stuff."

Who gave us such a nice compliment? Peter J. Brennan, the writer of the negative remark published in your July, 1980 issue.

Howard Y. Gosman, Publisher $H \& E$ Computronics, Inc. Spring Valley, NY
of these people is really getting small. Worse still, it will not cure what you believe to be a problem. The truth really is simple . . . because programmers know very well that programs are hard to protect and therefore control, prices are set high enough to recover a dollar percentage which will return a viable profit on investment.

Hobbyists in computing, as in radio, fishing, music and others, form common groups to exchange ideas, and yes, to exchange material or to jointly purchase items or materials. To call the members of such groups thieves or pirates would be ridiculous.

Consider the following example of a similar industry and problem.

Recording equipment is sold in various forms at most major stores in any community. These devices record either audio, electrical impulse, video or combinations of these. The next time you or a friend use the VTR to record that great movie from TV, remember the $\$ 25$ million cost to produce it, the $\$ 400$ daily rental loss, the $\$ 4.50$ ticket price not paid to the local theater, and in keeping with your thinking, label yourself and your friend a thief, or worse, a pirate.

I personally have 30 to 40 hours of taped movies; great movies, but I didn't pay for them. More importantly, I'm not selling them. That is my point; by my way of thinking, no one is a thief or pirate unless they take something from someone and use that something for personal gain. You have not proved to my satisfaction that this is, in fact, being done with computer programs. Rather than inhibit growth, users groups and exchanges of information have generated demands that have pushed home computer technology ahead at a faster rate than originally dreamed was possible.

Ronald Dudeck
Ontario, CA

## A Hobbyist's View

As a would-be computer hobbyist, and subscriber to several magazines, I have difficulty with the recent articles on theft and pirating of programs.

Since no one seems to write in behalf of the hobbyist, I'll take a shot at stating an alternate view. As usual, the press jointly pursue an issue and wholesale articles are written expressing a position on a subject affecting the publishing world directly.

My main objection is the association of theft and/or pirating as randomly applied to anyone accepting a program other than by direct purchase. It is bad enough to label and name call, but to offer rewards for arrest and conviction

## A Better Byte Loader

The RSM-2 machine language TRS-80 monitor from Small Systems Software, is a high quality product. It can do much more than Radio Shack's T-BUG and should be considered a necessity for any serious 80 user.

The 16 K cassette version sells for $\$ 26.95$ and a symbolic listing is available for $\$ 7.50$ to those who have purchased the tape.

1 have a modification to the RSM-2 which improves its byte loading utility.

The byte loader is activated by the U command of the RSM-2. To enter the loader program, type a $U$ and follow it with the hexadeci-
mal destination address of the first byte to be loaded. Hit the ENTER key and you will see the address displayed on the video monitor. You can then enter any desired bytes in hex code. Each character will appear on the monitor as you type, with a format consisting of an address followed by eight bytes per line, much like that of the familiar DUMP command.

While using the byte loader, three commands are available and can be used at any time following the entry of a complete byte. Pressing $L$ displays the next destination address and starts a new line. The left arrow deletes the last byte entered. BREAK exits from the loader and returns you to the RSM-2 command mode.

Chesney E. Twombly
Kennebunk, ME

Twombly subroutine A.

This symbolic listing shows the changes to RSM-2 that are required in order to implement the TRS- 80 better byte loader. RSM- 2 is the 16 K cassette version of the TRS-80 monitor available from:

## Browning Attacks

1 keep reading of the outrage and frustration that some folks suffer or seem to suffer from having their programs copied by scoundrels who won't buy them.
Let me tell you that your outrage is small compared to that of my own. I am a user of programs, not a writer, since 1 am much too busy and too inexperienced to write the complex and badly needed programs to assist me in the operation of a fairly large insurance agency.
1 have purchased many programs in an attempt to get what I need to run $\$ 11,000$ worth of computers, and have begun to realize considerable contempt for sellers of programs which are advertised to do something great. The ads do not tell what they don't do; sometimes they don't even work at all, and sometimes they disable the main program and make it unusable.
Consider a program called Pencil/Pal, supposed to add names from a mail list to a form letter created by Electric Pencil. It works. sort of . . . but the ad doesn't say that it disables the most valuable feature of Electric Pencil, that of being able to handle words in a continuous string, with Pencil dong the work of justifying and placing everything where it belongs. Also lost is the variable line length: You are stuck with 62 characters to a line and the necessity of a carriage return at the end of every line.
The $\$ 35$ is gone and the seller of the program won't give it back even though his program creates more problems than it solves.
I can give you many more examples since 1 have about $\$ 500$ worth of programs that don't work. I've got some darn good ones, too, but

I've had to go through pure hell to find them. You won't find me in the sympathetic group for those who cry about having their programs ripped off and not getting paid for what they supposedly do such a good job of. I've been "had" too many times by these guys. The ones who really do a good job get my money and my appreciation, and more than that, they get referrals.
1 am glad to part with my bucks to the guy who knows that he has to do a good job and take a little risk and sometimes even do it over to get it right.

1 think the one who does a poor job deserves some "advertising" too.
One other thought before I sign off . . . I sure get tired of waiting for that "fantastic new program." You know the one. Full color ads, all those features. But after you send your $\$ 100$, they tell you it won't be available for 60 to 90 days. Are they testing the market to see if there is a demand for the item, and if they get enough positive response they try to invent the product??
Goodnight VTOS wherever you are.
Kaye Browning
Roy, UT

## MicroComputer Responds

As author of Pencil/Pal, I would like to respond to Kaye Browning's criticism of our low cost ( $\$ 35$ ) form letter generating program. Pencil/Pal allows the user to automatically generate form letters from address and letter files which are created using the Electric Pencil, Scripsit, or any other text editor or BASIC program that produces ASCII files. Letters may be
printed to a subset of the address file by specifying one or two "select codes." The select code may be any string of characters in the address field or the user's own custom code (account \#. phone \#, amount due, etc.).

In contrast to Ms. Browning's comments, Pencil/Pal performs exactly according to its extensive documentation. Her comment that Pencil/Pal has "disabled the most valuable feature of Electric Pencil" is misleading. In fact, Pencil/Pal does not tamper with Electric Pencil code at all. I believe she is referring to the fact that the user must end each line of the form tetter with a carriage return (ENTER). This feature allows the user to format the output exact ly as desired (one is not "stuck with 62 charac ters to a line"). The user may elect to rightjustify or hyphenate his letter manually, a small inconvenience which may yield a more professional looking output than is possible with many word processors (hyphenation reduces the disturbing gaps between words that often occurs when the Electric Pencil justifies).

1 believe that Pencil/Pal is a functional, bar-gain-priced software package that saves a considerable amount of labor for those individuals or small businesses that require automatic generation of form letters.

1 would also urge anyone that is watching their hard earned software dollars to request a copy of a program's manual before investing in the actual software. Advertising copy cannot always tell you all the features or limitations of a program. The manual for Pencil/Pal is available for $\$ 5$ (applied toward purchase price of $\$ 35$ ).

Rodney B. Murray, Ph.D. President, MicroComputer Specialists Elkins Park, PA

## 80AID

## File Transfer Aid

Ed Maurer (July 1980) asked about communication between the TRS-80 and Digital PDP 11/70. I do it all the time between the house and the office where we run a DEC PDP 11/40 using the RSTS/E operating system and DEC's PIP program.
Ed doesn't say what operating system his machine uses but almost all DEC monitors have some version of PIP and would probably work. Of course the DEC machine will have to have a dial-up keyboard port.
At home I have a 48 K system with a Tandy RS- 232 board, a Tandy Telephone Interface modem and a couple of disks. The key is the software. I run Lance Micklus' ST80II Smart Terminal program.

Woods Martin
Houston, TX

## Power Outs

All microcomputer owners have had to live with disruptions caused by power failures. For reasons unknown to residents of Ashland, Oregon, we seem to experience this problem at least once (if not more times) each month.
Hardware is available to protect the CPU from power surges, but is anything available that could supply backup power during outages-so 1 wouldn't lose the program in the memory?

J. Ngan<br>P.O. Box 621<br>Ashland, OR 97520

Try May Day power supply devices from Sun Research, Inc.-Eds.

# 80 DEBUg 

## SET/RESET Bug

The following is a correction to the SET/RESET subroutine call which appeared in my article in the February, 1980 issue. The key is the loading of the HL register pair with the address of a right parenthesis. Unfortunately, I overlooked this omission when proofreading the article.

LD HL,RETRN PUSH HL HL

LD HL, 18DH
stack
stack
point to a right paren thesis

LD A.set/reset code
etc.
I have received numerous letters and phone calls about the article. There seems to be quite a large number of your readers who are interested in assembly language programming. Regrettably, I simply do not have the time to answer all the letters.

> Wes Thielke
> Mercerville, $N J$

## Revised Line Formatter

In my subroutine for formatting lines (page 162 of the July 1980 issue) there is a bug lurking which can at times cause an illegal function in line 30040. The malfunction is caused by the addition of 2 in line 30000 to set the number of lines to be printed. If the second line is not needed, a negative number will be sent to the argument of the RIGHT\$ instruction in line 30040, and this generates the FC message.

Alterations to fix the problem simply made the routine more bulky and complex, so I decided to revamp the whole thing. The
revised listing follows:

## CLEAR 510

10 REM - PUT LINE TO BE PRINTED INTO AS 20 GOSUB 30000
30 END
30000 R3 = O:AS = AS + CHRS(129):R4 = LEN(AS) 30010 FOR RI $=41$ TO $I$ STEP $-1: R S=\operatorname{MIDS}(A S, R 1$, 1):IF RS = CHRS(129) THEN 30040
30020 IF RS $=$ " $"$ THEN 30030 ELSE NEXT 30030 R $3=R 3+1: R 1 S(R 3)=$ LEFTS(AS,R1 -1$):$ AS $=$ RIGHTS(AS,R4-R1):R4 = R4 - 1:GOTO 30010 30040 FOR R2 = 1 TO R3:LPRINT R1S(R2):NEXT 30050 R5 = LEN(AS): LPRINT LEFTS(AS,R5 - 1):RETURN

In response to inquiries, this routine may also be used with printers having different print widths. Resetting the value of R1 in line 30010 to the proper width plus one is the only change necessary. For example, for a print width of 80 characters change the line to read:

30010 FOR R $1=81$ TO 1 STEP $-1:$. etc
John D. Adams
Sylmar, CA

## Swords and Sorcery Fix

All right, all right. So nobody's perfect. Granted, there were problems with our listing of the Swords and Sorcery program in the August issue. But it wasn't all our fault. You guys who insist on writing those 255 character program lines have to share some of the blame.
Since our print driver routine sources the program from an ASCII formatted file, super-long lines just don't make it. So, from now on, keep those lines around 240 characters and don't forget to include the line numbers when you're counting.
Listed below are the corrections you've been waiting for--Eds.

10 DATA $160,190,191,180,184,191,191,191,191,191,188,144$ ,160,186,191,191,191,191,191,191,191,191,191,191,1 $91,191,188,188,144,160,190,191,147,175,191,191,191$ ,191,191,191,191,191,159,131,179,191,181,160,190,1 91,191,151,160,191,191,168,191,186,

Swords and Sorcery fix conts.
Program continues

## A Second Opinion

Mr. Brennan has indicated in his letter in the July issue that there are problems with the Scripsit program, and that as far as he is concerned, Electric Pencil is a much better word processor. He is correct in the former, and probably correct-for him-in the latter, but I suspect the fact that he had EP first has somewhat biased his opinion. After all, nobody is denying that EP is an excellent program.

Here is what I did to overcome the problem that both he and I (and no doubt others) had when using the program with a serial printer. The specific problem 1 had is related to the way my printer (an Anderson Jacobson 841 I/O) handles combinations of carriage returns and line feeds. The printer ignores the first line feed after a carriage return. Unfortunately, Scripsit generates a line feed after a carriage return whenever it wants to do double line spacing or to insert extra lines between paragraphs (curse it!).

As Mr. Brenner states, if you tell the program that you want triple-line spacing when you really want double, you get it, but your page divisions are thrown out of place. Consequently, a little more devious method has to be used.

After a little research with a disassembler and a character search routine (both in MON4, by Hubert S. Howe), I used Apparat's excellent program Superzap to make the following changes to Scripsit.

Memory location 7171 H-(disk location 0 B 1 F 1 H ) and memory location 7185 H -(disk location 0 B 205 H )-change value 0 AH (line feed) to 0DH (carriage return) and the line feed problem vanishes.

The most obvious criticism of Scripsit concerns the instruction tapes, or rather the fact that no other way of learning Scripsit is offered. The tapes are in fact quite good, but I and quite a lot of other people who use the program have met word processors before. The idea of spending three to five hours listening to the tapes nearly stopped my wife from using the program altogether. Why there isn't an alternative way of discovering how to use the program, Tandy only knows.

Once you have toiled through the learning process, the documentation is perfectly adequate for reference purposes. However, I have some objections to some of the things I cannot do with text formatting statements. Despite all claims to the contrary, it is not possible to display on the video the text as it will be printed, since the video display has no provision to do formatting according to the imbedded printer formatting instructions. The second problem is the difficulty of imbedding control characters (such as back space) into the text. The third is that I cannot find a way to do "reverse paragraph indenting," i.e., having every line but the first of a section be indented by say, eight characters, while retaining right margin justification. This last may not be a normal requirement, but it is very useful if you deal with numbered sections in technical documents.

## EXATRON

Exatron is a California based corporation that has been in business since 1974. As well as the Stringy Floppy, Exatron designs, manufactures and sells state-of-theart electro-mechanical equipment for a variety of commercial and industrial applications. Exatron is an established supplier of automatic test equipment to manufacturers, and large OEM users, of intearated circuits worldwide.

The software in every ESF adds a parity bit to every byte saved on tape, and a checksum to the end of every file. These are checked both after recording data and upon replay, any detected error is indicated by a message on the video display. This system of automatic error checking gives confidence in any data saved, also each wafer is rated for at least 2,000 complete passes past the record/replay head.

- Assembled and tested
- All operating software in ROM
- Fully automatic operation
- Professional quality
- No Expansion litelface required
- Large Owners Assoçiation
- High speed operation
- Extremely reliable
- No technical knowledge needed

## WHAT IS IT?

The Exatron Stringy Floppy (ESF) is an extremely fast, reliable, economical alternative to cassette or floppy disk storage of computer programs or data.

Totally self-contained, the ESF has no buttons, switches, knobs or levers to adjust or forget. All of ESF's operations are under the computer's control.

## HOW DOES IT WORK?

The ESF uses a miniature tape cartridge (called a 'wafer') as the data storage medium, about the size of a business card and $3 / 16$ th of an inch thick. The tape used inside the wafer is a special Mylar based Chrome Dioxide type, specially developed for digital applications. Wafers are available in several lengths, 5 feet being the smallest and capable of holding up to 4 thousand bytes of information - the 75 -foot wafer is the largest available and can hold up to 64 thousand bytes of data.

The wafers contain a single reel of the special tape connected as a continuous loop, the ends being spliced together with a piece of reflective tape. In operation the ESF drive unit pulls the tape from the center of the reel inside the wafer, causing the entire reel to rotate. Thus, the tape automatically winds itself around the outside of the reel at the same rate as which it is pulled from the center. This process is similar to that found in an 8 -track cartridge.

The ESF transport mechanism is very simple, consisting of a precision die-cast aluminum block - with a capstan, drive motor and magnetic record/replay head mounted on it. The wafer loads into a slot in the casting (it will only fit the correct way) and the tape is driven at a single point by the capstan, past the record/replay head.

## HOW DO YOU USE IT?

Once connected to your computer the ESF operating system needs to be activat-ed-simple. Just type 'SYSTEM'(enter), and in response to the ? prompt type ' $112345^{\prime}$ (enter). Your TRS-80 will instantly display the ESF sign on message 'EXATRON STRINGY FLOPPY VERSION 4.1', and from this point onwards you will have the extra commands '@LOAD', '@SAVE' and '@NEW' recognized by your TRS-80.

The ESF's operating system is built into the electronics of the unit, in much the same way that BASIC is built into the computer, so it is always available - the SYSTEM command is to let your computer know that the ESF has been connected. If you normally reserve some memory for subroutines then the ESF software will relocate itself under your selected top of memory. The ESF uses only 4 bytes of your available RAM, these bytes are used to 'point' to the 2048 bytes of software in the ESF unit itself.

## WHAT'S THE CATCH?

Well, the only catch that most people find is that they have to actually pay Exatron for their unit! Even this is no big deal.

Starter Kits are available with the Exatron Stringy Floppy, a supply of wafers, a bus extender and a selection of useful programs for \$299.50.

Through regular advertisements in both Kilobaud Microcomputing and 80 Micro computing, owners are kept informed of the latest developments in wafer-based software. Plus hundreds of user 'workshops' are starting up over the country, so you can always be sure of being near to another ESF owner.

Exatron also gives a 30 -day full moneyback guarantee, with a 1 year parts and labor warranty on the unit.

If you have any questions about the ESF then give Exatron a call on the Hot Line (outside CA) 800-538-8559.

East Coast customers can call 800-3434424 (inside MA 617-899-3862)

Open House Workshops take place from 9 am till 1 pm every Saturday at Exatron's factory in Santa Clara, and on the East Coast the last Saturday in each month at Micro Communications, 80 Bacon Street, Waltham MA 02154. All are welcome.

Swords and Sorcery fix conts.

I must admit that I have not been troubled by Mr. Brenner's problem of not being able to read the disk directory directly from Scripsit, but then I didn't really expect to. I am annoyed by EP's habit of putting its own file extension on things-1 find that Scripsit is an excellent means for generating source files for the disk assembler (much better than the editor which comes with that assembler), and for that as well as for sections of a long document, I want to add my file extensions.

I don't find that the command formats of Scripsit are particularly cumbersome, particularly since they allow you to have several blocks marked at any one time-but that is one of those things that is subjective. However, the fact that EP loses characters at the ends of lines is a serious defect for anyone who types quickly (not me, I hasten to add).

For anyone considering buying either of these programs, I can only hope that these debates in the letter columns are a help. In my opinion, either is a good buy; Scripsit is $\$ 50$ cheaper, and I prefer it. Admittedly, it won't do some of the exotic format control which is available under UNIX on a PDP-11/70-but for a few hundred thousand dollars less, it seems pretty good value for the money.

## Subs for INKEY\$

I was reading Mr. Martinott's letter in the July issue which concerned Mr. Himler's article in the April issue, when I had an idea. I tried it and it works! I submit the following two subroutines:

## $1000 \mathrm{~W} \$=\cdot \cdot \cdot$

1010 WS = WS + INKEYS:IF LEN(WS) $<$ NC $\%$ THEN 1010 ELSE RETURN
$1500 \mathrm{WS}=\cdots \cdot \prime$
1510 WS = WS + INKEYS:IF RIGHTS(WS, 1) $>$ TCS THEN 1510
1520 WS = LEFTS(W\$,LEN(W\$) - 1):RETURN
Subroutine 1000 will return with a string of length NC\%. Subroutine 1500 will return with the characters input preceding the character in TC\$. Neither of these subroutines prints the string being input. If that is required PRINT@ PA $\%$,W $\$$;: could be inserted between IN KEY\$: and IF in lines 1010 and 1510.

Note that these subroutines have fewer restrictions than the regular input statement. Subroutine 1000 will input anything that can be input with INKEY\$, which includes all keyboard inputs except BREAK.

Subroutine 1500 also excludes the termination character in TC\$. In addition to the control codes that can be directly keyed in from the keyboard, such as line feed (the down arrow) or carriage return (ENTER), the ASCII control codes decimal 2 through 26 can be input by pressing the shift, down arrow, and a letter key B through Z. When you press the shift and down arrow, you get code 26 and then the control code when the letter key is pressed while holding down the shift and down arrow. This

## A Word for NEWDOS

It is with pleasure that I comment on three week's experience with Apparat's NEWDOS 80.

We have saved much time by using the DELETE/INSERT and DUPLICATE commands for program lines. These have proven invaluable in making major program modifications.
The improvement to SUPERZAP with the DFS command going right to the start of a file has helped our understanding of machine language and our debugging when setting up new files.

The manual tends to be grossly confusing at times and I sense the production of a new jargon which I don't care for, but overall the program has saved us time, and has saved us far more in money than it cost, even though we have only had it three weeks.

On this basis, which for a businessman is a primary consideration, NEWDOS 80 is an excellent program.

Peter G. Dunn Sturdivant and Dunn, Inc.

> "The principle of the clock is simple: Forty times each second, a pulse is sent from the expansion box to the keyboard unit. "

Does anybody really know what time it is? Does anybody really care?" Personal computers were still half a generation away when Chicago sang those words, but the phrase has a special kind of relevance for TRS-80 users. How can you get the time when you want it, yet prevent it from intruding when you don't need it?
Your 80 can tell time in two ways. Firstly, an 80 can be forced to keep track of certain predictable events, and update an internal clock program; and secondly, it can read an external clock which ticks along irrespective of the computer.

## Built-in Clock

The clock most familiar to Radio Shack users is that built into the expansion interface, which disk and Level III users can print by means of the TIME\$ command. The principle of this clock is simple: Forty times each second, a pulse is sent from the expansion box to the keyboard unit. The pulse enters via the interrupt line, causing the computer temporarily to set aside its activities in order to update the seconds, minutes, hours, days, months and year. When you ask for the TIMES command, the computer merely looks to the area of memory in which it has stored this updated information, and sends it to the screen or printers.
This method is easy to use, but there are some problems with it. Naturally, you need the expensive expansion interface and special software to use the 25 millisecond interrupt. To keep accurate track of the time and date, your computer must remain on 24 hours a day. Without disk, special tape software must be loaded if an inadvertent reset should occur. And don't forget that a CMD " T " must be executed before every CLOAD and CSAVE.
But more important than any of these, is the deleterious effect the 40 -times-per-second interrupt and update can have on a program is execution. To keep track of the real time, the in-
terrupt method steals valuable program time.
This month's column will present two inexpensive alternatives to the expansion box clock. The first of these is based on a once-per-second interrupt, reducing execution-time overhead to a reasonable amount. The other system uses a new integrated circuit clock chip, MSM5832, manufactured by OKI and available for $\$ 9.80$ from Digi-Key Corp. (P.O. Box 677, Thief River Falls, MN 56701, 800-346-5144).

Before we start wiring, let's find out what's important to know about computer clocks. The primary consideration regarding the clock itself is accuracy, especially if it is to be used by the computer to control external machinery, for example, which is critically time-dependent.

The expansion interface clock uses a quartz crystal time base, which is accurate to .001 percent. This percentage tells us that after 100,000 seconds (about one day), the clock will be fast or slow by one second.

But, there is an even more accurate source: the power line itself, which, because it is linked into a large network of generating systems, must maintain a virtually absolute synchronization over the long term of 60 clock cycles per second. Short-duration lags and leads may appear, but the percentage of error over a year is negligible.

## Ancient History

Other things to consider are 60 seconds to the minute, 60 minutes to the hour. That's our legacy from the Babylonians and their base-60 number system, so the computer clock has to remember that 59 plus one carries into the hundreds place. Then the Caesars gave us Julius and Augustus to deal with, meaning a duodecimal year, and some irregularly numbered months also turned up.

And finally, a pope named Gregory is remembered because the calendar bearing his name dramatically dropped a few days right out of the middle of the sixteenth century and
left us with an uncomfortable phenomenon known as leap year. Because of the vagaries of personal pride, tradition, astronomy and Renaissance, no number system, not even hexadecimal or octal, can compare in complexity with our very own calendar.
Fig. 1 presents a very simple interrupt-driven clock. You'll find no provision for battery backup, since clock updating is done by the computer-no power, no TRS-80. The transformer is 6.3 volts (Radio Shack H273-1384 will do fine). It both powers the circuit and provides the $60-\mathrm{Hz}$ pulse to the system. The sine-wave pulse is shaped into a neat digital signal by Schmitt Trigger Z1. Z2 divides the signal by 12, providing five pulses per second, and Z 3 then divides that by five. We are left with a one-second pulse at the output of Z 3 .

This signal isn't useful exactly as it is, though. Why? When the computer receives any interrupt, it sets aside its current activities and, via a specified program, services that interrupt. Within a few microseconds it's done with that process, and it tries to return to the main program. But the divided-down, one-second pulse is too long. It's on for one-half second, then off one-half second, which means that it will still be on when the computer returns to the main program. The computer, being ignorant and slavish, will bounce unquestioningly back to the interrupt routine and update the time again. And again. And again-until the pulse turns off. By this time, the clock is probably telling you it's tomorrow.

To remedy that problem, the one-second pulse is fed into a flip-flop. The computer provides a very useful handshaking signal called an "interrupt acknowledge" (INTAK), which in effect says, "Okay, bud, 1 got yer order. Now lay off." So when the clock's interrupt pulse goes on, INTAK immediately resets the flipflop, cutting the interrupt off; the CPU updates the clock, and is able to return to the main program. It is not again disturbed until the one-sec-

Fig. 1. Real-time Clock Using One-second Interrupts

# Enjoying 80 MICRO? 

## then read on...

80 MICROCOMPUTING has proven, in its first several issues, that it can give you more information on the TRS-80* than any other single source. The magazine has grown more informative with each month and we still have lots more interesting ideas in the works for you.

With the TRS-80* (or 90. . etc.) being the most popular microcomputer in the entire world, you are going to benefit from this in many ways. The more computers there are out there of one kind . . . the more good programs you are going to have for this system. I hope that is obvious. You may be sure that 80 MICROCOMPUTING will be packed with the shorter programs and reviews of the larger ones. You can waste an awful lot of money on stuff that looks great in the ads, but fizzles out when you try to use it. You need our reviews.

The wealth of programs will also mean that there will be much better programs for the TRS-80* than any other system. Put yourself in the seat of a computer programmer and you'll understand this. If you are going to spend several months developing a comprehensive program, and it takes all of that to write and debug a big program, would you write it for a system which has sold one hundred units or one which has sold over 300,000 systems? The answer is obvious...and this is why we are already seeing programs coming out for the TRS-80* which are far better than anything for any other system on the market. This is tough for other systems ...the law of the computer jungle.

Between our connections with Instant Software, the largest publisher of microcomputer programs in the world, and Kilobaud MICROCOMPUTING, you know that 80 MICROCOMPUTING is going to be your most important link with software for the TRS- $80^{*}$.

With Instant Software being sold and promoted in every country in the world where the TRS-80* is being soid, our input of programs is also the best in the world. We get programs submitted from everywhere...often from 50 to 100 a week! You'll get the cream of the crop either published or reviewed in 80.

## HARDWARE TOO

The same law of the computer jungle holds for hardware. Would you, as a manufacturer, market an accessory for a system which has sold 100 units or would you go
first for the one which has sold hundreds of thousands. It is, as with software, selfevident why the great bulk of the hardware accessories for computers are for the TRS-80* these days.
80 MICROCOMPUTING has the advantage of the use of the largest and most complete microcomputer lab in the world...the one developed for Instant Software and Kilobaud MICROCOMPUTING. This means that most new pieces of equipment are tested and in use by our staff... and this means that we can tell you what we think is outstanding... and where we find ripoffs. This lab is important to you.

## SUBSCRIBE

If you are not already a subscriber to 80 MICROCOMPUTING, please get signed up right now. The yearly rates are $\$ 18$, and that is a bargain. Just one single program of use to you can be worth much more than that. One review of an accessory could save you many times that much investment. I would appreciate it if you would appoint yourself a committee of one to get more subscribers for the magazine. You will benefit even more than we do here at the magazine... because the more readers we have, the more ads we will be able to attract. . . and the more ads, the more pages of articles you will get every month.

The 80 market can, I think, support a couple of hundred pages of ads... and that would mean a magazine of nearly 500 pages a month. That should hold you. You may not have time left to use your computer.

## ENCYCLOPEDIA

If you've read Kilobaud MICROCOMPUTING, you know that I try hard not to
duplicate published material. My concept is that every reader should save every issue (we sell inexpensive boxes for this so they can sit on your library shelf) and treat the magazine as a continuing encyclopedia of computing. I make sure that much of the material in each issue is written in simple language so it will be understandable by even the rawest newcomer to computers. Oh, I have articles for the more advanced users too, so you'll have something to look back over later and use as your understanding of your system grows.

Try to think of 80 MICROCOMPUTING as more of a large club newsletter than an ivory tower high-level publication. I'll leave the pomp to other publishers... the ones with the well-deserved inferiority complexes who cater to their inadequacies by publishing esoteric baloney. This magazine is written by the readers and edited by people whose aim is to help you enjoy your TRS-80*.

## SAVE

With each issue costing $\$ 2.50$ at your computer store, that's $\$ 30$ a year. For $\$ 18$ a year you can subscribe. . . at least for now. As the magazine expands, please do not be surprised if the cover price increases, along with the subscription price. I started 73 Magazine for radio amateurs twenty years ago with a cover price of 374 (two for 73¢) and it is up to $\$ 2.95$ a copy now (and it is the largest of the ham magazines).

For you bargain hunters... and those who find that one year goes by all too rapidly, the three year rate for 80 is $\$ 45$. This, too, will be going up. . . reflecting the inflation, paper increases, postage increases, and a short vacation for me in Hong Kong next year. Someone has to pay for that.

ond pulse again trips the flip-flop.

## Round-the-clock Time

You can build this real-time clock for under $\$ 10$ (cheap enough so you can toss it out if you purchase an interface). But for a few dollars more, the luxury of round-the-clock time is available. The secret is the OKI clock/calender integrated circuit, which is set up for use with microcomputers instead of LED readout digits. To make it work you will need a $32.768-\mathrm{KHz}$ watch crystal (also sold by Digi-Key), a port chip available at Radio Shack, and some simple logic.

The clock chip provides just about all the features we might need: time in hours ( 12 or 24-hour format), minutes and seconds; month, day and year (even leap year); and day of the week. Beyond the basics, the MSM5832 can provide timing signals to the computer 1,024 time per second, once per second, once per minute, or once per hour. A battery backup of just 2.2 volts will keep it timing when the rest of the system is off. Fig. 2 presents the complete timekeeping circuit for the TRS-80. (Since 74LS260's were in short supply when this article was being prepared, Fig. 3 is an alternate for that part of the circuit.)

The main disadvantage of the integrated circuit clock device is its technology. At present, low power consumption (for battery backup), high density (to squeeze the clock/calendar on the chip), and high speed (to be compatible with fast-moving microcomputers) are not all economically possible.

Although the MSM5832 is billed as a micro-computer-oriented clock, it is not directly compatible with the TRS-80. Intermediate logic
must be used to latch onto the clock information in its own good time and feed it to the 80 as the computer's signals speed by.

The INS8255 peripheral interface device does this job, setting up a slower, "private" bus between itself and the MSM5832. The data flows to and from the clock through the 8255's port A, the clock's address (for seconds, minutes, etc.) is selected through port $B$ and special timekeeping features are commanded through port C.
The 8255 circuit is wired so that the clock can be placed at an appropriate place in the TRS-80's memory map. The Z-80 microprocessor has 16 -pin connectons which are used to produce an address, or specific memory location. The highest number that 16 lines can produce is 1111111111111111 in binary or 65,535 decimal. Within this universe reside the different types of memory used by the 80 .
BASIC ROM uses the lowest 12,287 bytes of memory $(0000 \mathrm{H}$ to 2 FFFH$)$. The keyboard needs only eight bytes, but because of electronic and software design convenience, actually takes up an area 1,024 bytes long ( 3800 H to 3BFFH). Cassette, printer and disk eat up a few bytes from 37 E 0 H to 37 FFH , and the video screen has a 1,024 -byte block of memory reserved for its own use at 3 C 00 H to 3 FFFH . A full complement of RAM takes up 49,152 bytes from 4000 H to FFFFH.
That's a total of 63,504 bytes. What has happened to the remaining 2,032 ? They are blank, ready for crafty TRS-80 users to put them to work.

But we have to fit our clock in place carefully, if only because some manufacturers (Exatron with their Stringy Floppy and Personal

Fig. 2. Real-time Clock Using MSM5832 Clock/Calender

Fig. 3. Real-time Clock Using MSM5832 with Alternate Circuit to Replace 74LS260

## 80 APPLICATIONS

## How To Decode Tive Clock Addrees

Write the address in both hex and binary and determine the corresponding 2-80 address lines:

| 0 | 0 | 1 | I | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Rules:
1a. To create 37D0, eigh of these bits (address line) musi be 1 . Four of the bits must be 0 .
b. The lowest four bits will change as we select 8255 ports A, B, or C (37D0, 37D1, and 37D2).

2a. The 8255 integrated circuit is turned on when any address from 37D0 to 37DF appears. This "chip select" (CS) signal must be 0 for the 8255 to respond.
3a. The smallest possible number of IC chips should be used.
b. Only chips that someone manufactures should be used.
c. The chips you need will always be out of stock. Prepare options.

## Soletion:

-     -         -             -                 - 

1 There is no unique 37D0 address decodar made, so don't look for one.
2 Instead, remember the rules of logic:

| TyPe of Gate |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| A BPUT | AND | NAND | OR | NOR | XOR |  |
|  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| 0 | 1 | 0 | 1 | 1 | 0 | 1 |
| 1 | 0 | 0 | 1 | 1 | 0 | 1 |
| 1 | 1 | 1 | 0 | 1 | 0 | 0 |

3 Put the " 1 " lines ( $13,12,10,9,8,7,6$, and 4) into a plentiful and cheap eight-input NAND gate (type 74LS30). Result: a "0" output.
4 Put the "0" lines (15, 14, 11, and 5), plus the above "0" output into a five-input NOR gate (type 74LS260).
Result: a " 1 " output. That decodes all the lines, and it's pretty close to what we need.
5 Put this " 1 " output into an inverter to change it to the " 0 " needed to trigger CS. Wait, now, don't get a separath inverter chip. Since the 74LS260 has another five-input nor gate on board, send the previous " 1 " output into all five inputs of this gate. Voila! Instant inverter.
6 Use Fig. 3 when 74LS260s are out of stock everywhere you call.

Photo 1. The complete clock/calendar can be built on a small circuit board. Notice the 32.768 KHz crystal on the far left; it is attached to the board with instant glue.
difference of 0.3 volts between certain pins of this chip can be deadly.
This board can be wire-wrapped or soldered, though use great care, little heat and short ieads when soldering the crystal in place. Photo 1 shows the entire circuit on a $\mathbf{2 7 6}$-170 circuit board.
Very important to the proper operation of these clock circuits is a ground connecting the computer at edge card pin 29 to the peripheral device's ground, as in the schematics. I have seen. several home-brew devices which would function in most frustrating manner until this ground was put in place. Also, take note of the capacitors between Vcc (collector-voltage sup-

## 80APPLICATIONS

ply) and ground in both circuits. These should be mounted as close as possible to their respective integrated circuits so they can filter out extraneous signals caused by fast-switching ICs. The pull-up resistors (R1 to R12 in Fig. 2) are essential to the operation of the MSM5832. See Fig. 4 for a diagram of the power supply with battery backup for the MSM5832 clock.

Next month's column will cover machine language and BASIC software for using these real-time clocks.

## Letters about Applications

Some unexpected difficulties can plague those of us working on hardware additions to the TRS-80. Ron Gillen of Hustisford, WI writes to say that TRS-80 "edge card connectors are not created equal...I purchased a 40-pin edge card connector to replace the failed (cheap) Stringy-Floppy 'Kel-AM' connector. A much more rugged Alpha Mfg. connector was used and, to my dismay, the pins on the edge card side are reversed as pairs. That is, Kel-Am places pin 1 at the top of the edge card and the particular Alpha that I purchased places pin 1 at the bottom of the edge card. This reversal of pairs, which I did not suspect, caused strange and interesting results on the TRS-80 when connected to the ESF cable."

I had the same problem as Ron while building a prototype for this column, so check those cables carefully.

Several readers have asked where to get parts for projects described in this column. In most cases, parts are readily available from a local Radio Shack. Where special parts are needed, the names and addresses of suppliers will be listed. This question was prompted by the inter-
face published earlier this year. By the time the article appeared in print, Radio Shack had discontinued the 81LS95 and 81LS96 circuits. For those still interested, these ICs may be obtained from any of the mail order firms mentioned in this column.
Will readers who have built or plan to build the device please drop me a post card (Roxbury, Vermont 05669)? Future columns will refer to this small interface if readers have built it and find it worthwhile.

Mea culpa, indeed. Chuck Lingo writes from Gardner, KS about those BASIC commands accessible using Seespot! (July):

Your article said all BASIC commands, yet there are only 64 graphic characters and 86 possible key combinations. Where are things such as CHRS, STRS, LEFTS, RIGHT\$ . . etc.?"
An earlier version of the Seespot program being developed made those extra commands available, but I lost them along the pathway to user convenience. Sometime soon this column will present a quick way of evoking all those BASIC commands via single keystrokes.

A quick note on the vagaries of electronic developments: This month's topic was well on its way to completion using some entirely different hardware. Until March, when OKI officially introduced the MSM5832, there were only standard clock/calender chips on the market.

In order to make them microcomputer compatible, the seven-segment LED display outputs had to be converted to binary, using either a home-programmed PROM or a special-purpose National Semiconductor IC. The clock chip's digit strobe was converted into an addressing circuit, and some fancy electronic spaghetti allowed this entire mass to act as a computer clock.

It also cost a lot of time, more money- $\$ 30$ and having a friend who could program small PROMs. The OKI data sheet walked through the door at just the right moment, promising to be the perfect solution. But that solution is still some time away, when a computer-bus-compatible, high-speed clock chip finally appears on the market.

# FDOCS 

The first question of the new 80 owner is: "How and where do 1 get programs?" You may be a teacher carrying your personal 80 to the classroom. You may be a parent wishing to supplement your child's schoolwork. Perhaps you are in charge of a learning lab with several 80s, or a parent wanting to get your preschooler off to a good start. In any case, there is always a search for good programs.

That need arises again and again when talking with educator-users. Unfortunately, there is no simple answer because the sources are many and, at the same time, few.
At this point in time, there are several ways to acquire instructional programs:

- Write your own programs; this is probably your very best source. Better than anyone, you know what you want to teach and you know the student(s)-where he needs to begin, how he learns best and so on. If you don't know the
subject well enough-small engine repair, for example-collaborate with a colleague who does.

This program source is the least expensive but it does take time, a commodity that most of us have in short supply. Since your time is not unlimited, why waste it reinventing the wheel? Write what is not available and get what someone else has already invented.

- Copy programs from magazines and books; program listings can be found in many books and magazines. It is true that most are not instructional, but if you look carefully, you'll be surprised how many fall into that category. In addition, you will find others that you can modify in one way or another to turn them into teaching programs.
- Exchange programs with others; this can be a really fine source of programs. You will get a bummer now and then, but that happens

1. Outlasts every competitor- $200,000,000$ character head warranty
2. No duty cycle limitations-even in demanding business applications
3. Professional print quality $-9 \times 7$ matrix
4. Rugged business use construction-metal chassis-two motors
5. 80 characters per second
6. Upper and lower case-full 96 character ASCII set
7. Double width characters
8. Connects directly to TRS-80TM APPLE ${ }^{\text {™ }}$ and other computers
9. Block graphics- 64 shapes for charts, graphs, diagrams
10. Friction and pin feed
11. Plain paper-up to 3 parts
12. 6 and 8 lines per inch-program controlled paper savings
13. 80 and 132 columns-program controlled
14. Price-the best value in the industry. Call or write today for the name of your local Microline 80 dealer.

## 14 REASONS WHY TRS-80 OWNERS CHOOSE THE MICROLINE 80

All fourteen are standard with every Microline 80. The only options are snap-on tractors and a buffered (up to 2000 characters) RS232 interface.

# OKIDATA <br> $-245$ 

[^0]when you buy them, too. Exchanging what you have written for what someone else has written is a good and inexpensive way to build up your program library. The cost is limited to your blank tape, postage and, in some cases, a nominal fee.

There are some educationally oriented exchange groups on my present list. I'll share the names and addresses of any exchange groups that send me information about themselves provided that they refuse to exchange copyrighted programs. (I won't help them break the law.) If you represent such a group, send me your list and your rules.

- Buy the programs you need; there are some competent and reliable people out there who are writing and selling educational programs. I am also painfully aware that there are some incompetents and/or crooks doing the same thing!

There you have the methods of acquiring educational programs: write them, type them, exchange them and buy them. Do some of each. And don't forget that you can often modify a program to improve it or make it useful for another purpose.

## Educational Review: Three Program Books

As I mentioned above, one of the less expensive ways to get programs is to type them from listings in books and magazines. It takes some time and care but the cost is much less than buying them on tape. Here are three books in which you may be interested.

- 57 Pracitical Programs and Games In BASIC (Ken Tracton; Radio Shack \#62-2008)
The presentation of these programs includes a brief description, any math formulas used, a sample run, a list and a flowchart. As the title indicates, the programs are in BASIC. Most will run on Level Il as written, but a few require modification. For Level I users, more extensive modifications are needed.

Though this volume is well written, there is little here applicable to education except for the advanced math student.

Contents: mathematical functions (42); games (8); electronics (3); miscellaneous (4).

- 80 Programs For The TRS-80 (Perry and Brown, editors; 1001001 Inc., Peterborough, NH 03458)
This book was offered originally as a bonus to charter subscribers of this magazine. The listings are in small print but there are plenty of them. All but a few of the programs will fit into a 16 K machine. You will find a variety of educational programs here.
Contents: instruction (15); business (13); games (15); utility (6); personal use (10); energy conservation (3); amateur radio (6); electronics (4); miscellaneous (8).

Instruction breakdown: electronics (1); math (6); social studies (4); reading/spelling (3); music (1).
-TRS-80 Programs (Rugg and Feldman; Radio Shack H62-2064)

This book contains 32 programs for Level II. All will fit into a 16 K machine and most will fit into 4 K . Each program is explained in thorough
detail including suggested modifications for different uses. The program discussions are so complete that this volume is excellent for study by example, to improve your own program writing. One of the instructional programs (Flashcard) can be used with many subjects and grades.

Contents: instruction (7); games (13); personal use (2); business (1); math functions (9).
When you are typing a listing into your 80 be very careful-go slowly and check often what you have entered. You know that the smallest mistake can prevent a program's running. Especially watch out for the letters I and O as compared with the digits 1 and 0 .

If you have several programs to type, try to talk a friend into typing half of them. You can then exchange cassette copies and each of you will have saved half the time. In any case, it is a good idea to take a typing break now and again; being tired leads to misteaks!

## Recording Scores

You may want to record your student's score on an instructional program. If you have even the simplest printer, you don't have to copy scores manually from the display. The following listing will do the job on the Radio Shack Quick Printer II. Change the commands to suit
your printer:
1030 PRINT "PLEASE SWITCH ON THE PRINTER AND THEN PRESS ENTER."
1035 IF INKEYS = $\cdots \cdot$ THEN 1035
1040 LPRINT "NAME: "AS :'NAME PREVIOUSLY ENTERED
1045 LPRINT "PROGRAM : AMATEUR THEORY II"
1050 LPRINT "SCORE : "R"RIGHT OF "T" ATTEMPTED*
1055 FOR X $=1$ TO 4 : LPRINT : NEXT 1060 END
The variable names will have to be changed to agree with those in the program. If you're wondering about line 1055 , that simply runs the paper up four lines so that the printout clears the tearbar.
This small section prints the essential information and is easily expanded to include whatever you want on the record. Best of all, not only can you put it in programs that you write, but you can insert it easily into any you have written or any that you have bought.

## A Reminder

Don't forget to send me information on your program exchange group so I can pass it along to other readers. And let me know of any special topics you would like discussed in the future.

L
ast night, a warm Sunday evening, while my dog and I took our customary walk, I bumped into my next door neighbor. He looked harassed and down in the dumps. On inquiry, he told me a sad tale of his slaving over the books in his office all weekend long. His major problem was getting the payroll recordkeeping up to date in order to file his quarterly returns.
His was a sad, but familiar tale.

## CP/M and CBASIC

Radio Shack has recently released the Model II Payroll package (Catalog \#26-4503). Although this effort has some flaws (such as no New York city withholding computation), it represents a substantial piece of work. It can certainly be considered for locations where a city tax is not required or can be calculated as a percentage of gross pay or federal tax.

In addition to the Radio Shack package I will also evaluate the Structured Systems Group, Inc., (SSG) CP/M (Control Program for Microcomputers) payroll package.

It's no secret that TRSDOS has many disk operating system competitors. The most popular of the alternate systems is CP/M, developed by Digital Research, Pacific Grove, CA. CP/M was established as an industry standard long before the Model I TRSDOS was a working system. In fact CP/M was almost adopted as the Model I operating system and was licensed by Tandy although it was never released.

The major problem with CP/M in the Model I was that standard CP/M required low memory in order to work. This area was already used by the Level II ROM. CP/M had to be rewritten to function above the ROM.

Because CP/M has been readily available, many firms have developed software to integrate with it. One such firm, Software Systems, Inc., developed a BASIC interpreter called CBASIC. CBASIC differs from standard Radio Shack BASIC by requiring a compilation phase before execution. At the conclusion of the compilation phase, a special program is created that can be executed but not listed. It is interpreted by the run-time module of the CBASIC system. In this way vendors of CBASIC programs can retain control of the source code. This means that purchasers of CBASIC programs cannot modify the programs without the assistance of the vendor.

## SSG Payroll

One of the vendors using CBASIC and CP/M is SSG of Oakland, CA. Their payroll system is distributed by computer stores throughout the country and is part of a total integrated accounting system. Although the system is distributed on three single-density eight-inch disks, it will run on a two-drive Model II. Drive A (equivalent to drive $\mathbf{0}$ in a TRSDOS system) contains the system and drive B (equivalent to drive 1) contains the data. The

# Transform your programming language into a real data base management system 

HDBS intertaces
with CBASIC under CP/M, with TRS-80 (Models I and II), and with APPLE DOS.

A major breakthrough in data handling for micros! At best, existing programming languages provide only rudimentary file handling capabilities. With HDBS (Hierarchical Data Base System), you can now transform your programming language from an ordinary file handling system into a flexible, powerful, and productive data base management system.
HDBS provides the two components any genuine data base system must have:

1. The Data Description Language (DDL), an easy-to-use, stand-alone language for specifying blueprints or schemas of data base organization.
2. The Data Manipulation Language (DML) for manipulating (storing, accessing, modifying, deleting) data organized according to a data base blueprint. The DML extends your data handling capabilities by allowing you to embed powerful data manipulation commands in the programs you write. The commands are stated through the "CALL" facilities of your programming language.

## HDBS users are...

- free of the need to design files.
- free of the need to merge files; there is no scattering of data over several files. Records of many different types are automatically maintained in a single, integrated organization... one that can be spread over numerous disk drives.
- free of the need to be concerned with disk I/O because it is handled automatically by HDBS.

## HDBS offers...

- hierarchical schema designs.
- data base schemas of up to 254 record types; each record type may contain up to 255 fields. The size of a field may be up to several thousand bytes in length.
- data bases spread over one to eight disk drives. HDBS is independent of the sizes and types of drives.
- user-defined names for fields, record types, and sets.
- records maintainable in several sorted orders. . . and in other orders as well.
- written in machine language for maximum execution efficiency and minimal memory usage.
- available versions: $\mathbf{Z 8 0}$ (requires approx. 18 K ), 6502 (approx. 26 K ), 8080 (approx. 22K). Total memory requirement must allow for buffer areas.

For more information on the HDBS, write or call us today!

## HDBS can be used to extend any of the following programming languages under the indicated operating systems:

CP/M with CBASIC; Microsoft BASICs,
FORTRAN or COBOL: InterSystem
PASCAL/Z; Sorcim PASCAL/M; Micro Focus
CIS COBOL: Digital Research PL//
MVT/FAMOS with BASIC
OASIS with BASIC
TRSDOS and NEWDOS (Models I and II) with Disk BASIC
North Star DOS with North Star BASIC
Apple DOS and Applesoft BASIC
Machine Language interface available on all above systems.
Note: Because HDBS can be integrated with a wide range of languages and operating systems, it provides uniform methods of data handling across those many languages and systems.
HDBS/QRS. An interactive Report-
Writer/Query-System with these features:

- may be customized for non-technical users.
- complex retrieval conditions may be specified.
- detailed reports can be quickly generated.
- wildcard and "match-one" string specifications included.
HDBS/SRS. This Schema Redesign System permits...
- renaming fields, record types, sets
- adding new fields to existing record types.
- allocating additional pages to an existing data base.
Ordering information (applicable to Z80,
8080, and 6502 versions):

## Micro <br> Data liase <br> Susitems, inc.

Box 248, Lafayette, Indiana 47902
317-742-7388 or 317-448-1616

CP/M and CBASIC software required to run the system are not included.
Simple payroll systems usually involve a combination of automated and manual techniques. Automation is generally applied to the mechanical calculation of the withholding taxes and net pay. Check writing and maintenance of employee earnings data must be accomplished by hand. Because many devices used for automation purposes have the capacity to store the payroll data, cumulative totals can be carried forward to permit the preparation of required tax returns.
Payroll preparation does not require complicated calculations. Most of the parameters are defined by federal, state and local withholding charts. Since these charts are usually quite short, they can easily be accommodated in memory and referenced by a table look-up routine. This routine usually converts gross pay to an annualized figure by multiplying it by the payroll frequency. The resulting figure less exemptions is referenced to the various tables to calculate the tax due. The tax is then divided by the same payroll frequency to determine the tax required when calculating net pay. For the current pay period these calculations must be performed for every eligible person on the payroll.

A series of parameters is supplied for each employee to determine which tax table is used and which exemptions are to be applied. Typically these are specified on the employee earnings master file. This master file is usually quite long and complex. For example, the employee master file in the SSG payroll system is almost 700 bytes long.
The need for such large files limits the amount of data that can be accumulated for each employee. For this reason neither Radio Shack's nor the SSG's payroll system have a detailed employee earnings history. Both systems carry cumulative quarter-to-date and year-todate information only. This can create a problem if it is necessary to know payroll data by employee for specific pay periods. Otherwise, both payroll systems will do an excellent job of keeping payroll records.

## Similar Features

The features of the two systems are similar in many respects. Both calculate deductions from employee wages for federal income tax withholding, Social Security, state disability and state and local income tax.
Both systems allow you to preload the employee payroll earnings record with information that remains constant for each pay period. If there are no changes, payroll calculations will be automatic. Default tax rates for FICA and federal withholding tax tables are also provided by both.

The Radio Shack payroll will not handle local income taxes, if withholding is based upon a table. It will only handle local income taxes if the withholding amount is calculated as a percentage of gross pay of Federal Tax.

Radio Shack's Model II Payroll package uses two special function keys, F1 and F2, to control editing and data entry. Because the SSG's package was not designed for a specific
function, keys are not enabled. The control key and lettered key combinations are used to allow you to call files or update records.

While the SSG system provides payroll withholding tax tables for New York state and New York City, the Model II Payroll package provides the guidelines to generate the necessary tables for all 50 states.
Payroll data is entered into the SSG system in batches. Although the screen presentation and data entry phase are relatively cumbersome, the number of different items that the system will accept is outstanding. Data such as withholding tax overrides, special payments and expense reimbursements are easily accommodated.

The Model II Payroll's data entry screen displays the full gross to net calculation. Changes are easily made to the necessary fields and the calculation is updated instantly. In addition, there is a time card calculator mode which allows you to input daily hours and calculate the weekly hours right on the screen, which is a great aid to data entry. At the conclusion to the data entry phase, a payroll journal can be printed.

In the SSG system the data that is entered must be sorted and a batch listing prepared before the payroll can be calculated. From a security point of view, separating the data entry function and calculation procedure is better. In the Radio Shack system it is quite possible to edit a payroll after checks are printed, and reprint a single check. It is not possible to do this in the SSG system.

Both systems use a preformatted check. Checks will have to be ordered that are compatible with each system's printing program. Both systems print payroll journals, check registers, and journal entry data. Both can also be integrated into a companion general ledger system.

The SSG program differs in handling payroll expense information. In the SSG system it is possible to arrange employee payroll expense in five categories on a percentage basis. For example, if a employee works half his time in design, and half his time in sales, it is possible to distribute half his earnings from a sales payroll category and the balance from a design payroll category. The Radio Shack Model II Payroll cannot. Regular time, overtime, double-time, vacation and holiday payroll categories are used instead.

## Application Lumits

The lack of a payroll distribution by cost center in the Radio Shack payroll could limit its application in firms with many payroll cost centers. The only alternative would be to prepare a separate payroll for each cost center, so that payroll expense can be charged to the proper accounts.

However, in environments where an analysis of gross pay is necessary and overtime pay, vacation, holiday and sick pay must be separately identified, the Radio Shack payroll system has a clear edge. In the SSG system these items are not separately identified. They are combined with the FICA and UIT tax expense in determining the total salary charge.

From an accounting standpoint, combining
salary and non-salary amounts into a single account is not desirable. To perform a payroll audit the pure salary expense figure must be available for review.

Both systems prepare a full spectrum of quarterly and annual reports. In addition, master file printouts and individual employee records are available showing cumulative earnings paid, along with other year to date statistics. The SSG master file also has provisions for accumulating data, such as accrued vacation and sick pay. These statistics are not available in the Radio Shack payroll. The SSG payroll costs $\$ 1,250$ and is available from distributors of CP/M systems throughout the country. In order to run the payroll, purchase of the CP/M operating systems and CBASIC is required. Because CP/M for the Model II costs $\mathbf{\$ 1 9 5}$ and CBASIC costs an additional $\$ 100$, the total cost of the SSG payroll system is a shade over $\mathbf{\$ 1 , 5 0 0}$. The Radio Shack payroll system costs less than $\$ 400$ with slightly fewer features.
There has to be a powerful incentive to spend the additional $\mathbf{\$ 1 , 1 0 0}$ for the SSG payroll system.
The SSG system represents a mature software system which has already been used many times. The Radio Shack system, on the other hand, is a brand new package. Experience with new software products indicates that there will probably be a "shake out" period before all the bugs are worked out: Bugs can contribute significantly more than $\$ 1,100$ of aggravation in an industrial environment.
An example of the care in the SSG system design is the use of data files with numbered extensions. If a foreign file gets into the system, the internal number checking of the operating system will indicate that an error has occurred. These advanced techniques are generally transparent to the user, but should an error occur, an error message will appear so that recovery procedures can begin.

## More Information

Considerably more information is provided about the SSG system than the Radio Shack system despite the fact that Radio Shack's has a source code listing. The SSG system is also designed to accommodate additional custom programs. If you wish to write a program to accumulate employee earning statistics, it can be incorporated and selected from the menu. The structure of all files and a complete input and output tracking of each run is provided for programming. This can also be used to aid restart and error correction procedures.

While there is no doubt that Radio Shack software will also include this data at sometime in the future, the payroll documentation package is not there yet. It is a good bet that as Radio Shack software is distributed to more commercial environments, the documentation and system controls will eventually evolve to the same level as the SSG system.
Although the SSG system represents a more mature, flexible and comprehensive system, the Radio Shack payroll system, if used with knowledge of its limitations, will prove a useful accounting tool as well.

# If You've Ever Dreamed of Flying <br> These 7 flight simulation programs can take you aloft, into the realm of powered flight. We're Instant Software-Fly Us! 

## Night Flight

May, 1941-The dreaded Axis battleship, the Bismarck, has broken out of the North Sea and is now somewhere in the North Atlantic. Your mission is to make a nighttime photo reconnaissance flight over the Bismarck. These photos will help the Admiralty determine the extent of damage done to the Bismarck in a previous battle and whether the British fleet has a chance to sink the German pocket battleship.
The Night Flight program lets you take-off, fly, and land a propeller driven aircraft. You can practice approaches and landings with a full on-screen display of the landing field information. The instructions with this program can practically teach you to fly.
Somewhere out on the cold, gray North Atlantic, the Bismarck tries to elude her pursuers. Your photos are vital. Launch yourself into the night sky with the Night Flight package.
Order No. 0117R \$9.95
$\square$

## Air Flight Simulation

Your aircraft is on the runway loaded with fuel, instruments feeding the computer a constant stream of information.

A glance at your flight screen gives you airspeed, altitude, and compass heading. After you take-off, the all important Ascent/De-scent-Turn/Bank Indicator will tell you the attitude of your aircraft at a glance, whether you are climbing, diving or banking into a left or right turn.

Your mission is a short one. You have a maximum possible range of about 50 miles, on one precious tank of fuel. Your objective is to takeoff, fly the aircraft, and land without crashing.
You may not have been at the controls of an aircraft before. The basic flight instructions enclosed will be invaluable. Included are explanations on basic aerodynamics and principles of flight, plus illustrations telling you how to recover from dangerous maneuvers.
Your aircraft will respond rapidly to the controls, and your movements must be delicate. Too much airspeed and your aircraft could explode from overstress. If the airspeed is too slow, you might stall and crash. A clumsy turn, and you might find yourself flying upside down, fighting to regain control.

It will take a few hours of flight time, before you can take-off and fly a correct flight plan. By then you will be expert enough to attempt aerobatic maneuvers.

With Air Flight Simulation and enough flight time, the sky's the limit!
Order No. 0017R \$9.95

## Flight Path

The Flight Path package will let you experience all aspects of modern day aviation.
Mountain Pilot transforms you into a daring bush pilot as you fly badly needed supplies to a remote gold mining camp. You'll have to cross a hazardous mountain range, while struggling with headwinds, tricky navigation and rapidly diminishing fuel.
Watch your airspeed, altitude and rate-ofclimb or you could stall-out and crash. If you deliver your supplies, you can't relax; you must return over those mountains with a heavy cargo of gold bullion.
O'Hare is a control tower simulation where you become an Air Traffic Controller. The lives of hundreds of people become your responsibility as you guide aircraft through your control sector to a safe landing.
You'll have to deal with different aircraft requirements, wind change warnings and potential midair collisions. But no matter what happens, you must bring in each of the twenty aircraft in your tour of duty.
Precision Approach Radar combines the skills of pilot and Air Traffic Controller. You become the pilot's "eyes" as they try to land in limited visibility conditions. Your commands guide the aircraft in its approach to the field and a safe landing.
The Flight Path package covers both sides of flight procedure, from the thrill of flying to the tense drama of air traffic control.
Order No. 0171R \$9.95.
TO ORDER: Look for these programs at the dealer nearest you (see list of dealers on page 206). If your store doesn't stock Instant Software send your order with payment to: Instant Software, Order Dept., Peterborough, N.H. 03458 (Add $\$ 1.00$ for handling) or call toll-free 1-800-258-5473 (VISA, MC and AE accepted).

Prices subject to change without notice.

## Jet Fighter Pilot

The Jet Fighter Pilot package takes you as close to real combat flying as possible. . . without pulling G's.
In this brilliantly realistic simulation, you become the pilot of a high performance, twin turbo-jet fighter. Total control of the aircraft is yours.

At the start of your mission, you'll go through an entire engine start procedure before your flight (provided your ground maintenance is up to par). Your takeoff will be from either the deck of an aircraft carrier (via a steam catapult) or from an airfield.

All controls respond the same as they would on a real jet fighter. You'll have to constantly monitor your display and make adjustments to your throttle, flaps, rudder and air spoilers. You decide when to retract flaps, landing gear and release the auxiliary fuel drop-tanks.

Your on-board navigational computer will direct you to your selected airport. The Glideslope/Localizer information will aid you in approaching and landing on an aircraft carrier deck or airfield.

The Weapons Control Computer will arm your missiles, provide you with the range and bearing to a target, and tell you when to attack. And, if things should get a little too hot, you have an ejection seat command for egress.

For a carrier-based landing, you'll have to deploy your tail hook. For a land-based landing, you'll need reverse thrust and your drag chute.

After you've flown a few missions with the Jet Fighter Pilot package, you'll know you've earned your wings.
Order No. 0159R \$14.95

## Airmail Pilot

Let the Airmail Pilot package take you back to the early days of aviation history. Your plane is the Curtis JN4-D, affectionately known as the Jenny. You must fly the mail from Columbus to Chicago.

The Jenny carries only 26 gallons of fuel. You'll have to stop along the way. Bad weather may force you down. Electrical storms may turn your aircraft into a mass of flaming wreckage, or ice may form on your wings and plunge you to certain death below. But, the mail must get through.

The onboard clock will show your elapsed time. Your mission is to complete the flight as quickly as possible.

Experience the thrills of flying, when aircraft were mere fragile machines of wood and fabric, with the Airmail Pilot package. (Scarf and flying helmet optional.)
Order No. 0106R \$9.95

## Cosmic Patrol <br> WARNING: PLAYERS OF THIS GAME SHOULD BE PREPARED FOR A STATE OF REALISM HITHERTO UNAVAILABLE ON THE TRS-80

The Cosmic Patrol program puts you in the command chair of a small interstellar patrol craft. Your mission is to defeat Terran space and prey on the Quelon supply ships which carry essential parts and lubrificants for that implacably hostile robotic force. The drone freighters are fairly easy pickings for the accomplished starship pilot, but beware of the I-Fighter escorts. They're armed, fast and piloted by intelligent robots linked to battle computers. They never miss.

The Cosmic Patrol program is not just another search and destroy game. With its fast, real-time action, impressive sound option and superb graphics, this machine-language program is the best of its genre.

Don't keep putting quarter after quarter into arcade games or spending big bucks for video game cartridges. Get Cosmic Patrol from Instant Software-and get the best for less! Order No. 0223R \$14.95

## Ball Turret Gunner

"No personal consideration should stand in the way of performing a public duty."

A 19th Century Terran military commander
For years the Petro Resource Conglomerate has attacked our photon collection stations and strangled our deep-space trade routes. The PRC Exxonerator Class light fighters (code name: Gnat) have been their main weapon. Now you can strike back, by joining the Ball Turret Gunner Service.

Imagine yourself at the control console of an LW-1417 Stratoblazer (Type B Strategic Laser Weapon). Your Hindsight Director informs you that a Gnat fighter is coming in for an attack. You pivot your gigawatt laser turret until you can see the target on your monitor. The Range Indicator shows him coming in fast. The Targeting Computer studies his course and speed as your finger tenses over the firing key. You know you'll have only a fraction of a second in which to react. The Gnat fighter's evasive maneuvers cause him to dance in your sights. Suddenly, you see the FIRE Command and you react instinctively. Your laser beam lashes out and reduces the Gnat to an expanding ball of ionized gas. Mission accomplished!

Ball Turret Gunner, with your choice of multiple levels of difficulty, optional sound effects and superb graphics, is more than just a game. It's an adventure. Experience it!
Order No. 0051R \$9.95

# "Typical program samples include preliminary comments, fully annotated source code, line by line explanations and descriptive notes.'" 

Inside Level II
John Blattner and Bryan Mumford
Mumford Micro Systems
Summerland, CA
Softcover, 65 pp .
$\mathbf{\$ 1 5 . 9 5}$

## by Dennis Bathory Kitsz

Computers like the TRS-80 have somewhat dulled our sensitivities. We accept crude screen imagery and dream of high resolution graphics, which are still a far cry from finegrained photography.
Four hundred years of design have given us a wealth of elegant typefaces that express the utility of writing and please the eye, yet we are content, even enthusiastic, with the unpleasant dot matrix characters on video and printer. We perceive squawks and bleeps as something reminiscent of music, in spite of composers and performers who cringe at these frigid sounds.
It was a refreshing experience to receive Inside Level II, a volume of valuable information about the TRS-80's ROM, yet immensely thoughtful, literate and cleanly designed. Mumford Micro Systems may be a small company, but it isn't a member of the 'type it, copy it, bind it in the attic" crowd, represented by many shoddily prepared volumes.

Pioneers though we all may be in this field, we should not permit our aesthetic senses to be bludgeoned. For their artistic efforts alone, Mumford Micro is to be thanked.
Inside Level II is the result of a cooperative effort by John Blattner and Bryan Mumford. It presents 18 chapters of detailed descriptions of and applications for ROM subroutines and entry points.
Blattner and Mumford tell us in their introduction that there is an efficient scheme for linking BASIC and assembly language programs: "The result can be a single, smoothly joined program that combines the best features of both languages - the ease of writing, string capability and input-output powers of BASIC, together with the speed of execution of assembly languages. It is not atypical for 25 percent of
a given program (written entirely in BASIC) to require 95 percent of the operating time. If this time-critical part can be rewritten in assembly language and efficiently linked to the remainder of the BASIC program, one can enjoy the best of both worlds."

The text begins with a general presentation of the way BASIC is organized throughout ROM and RAM. Important memory locations and the major entry and exit points of ROM subroutines are detailed. ROM utilities (registers, buffers and variables) are covered, and three chapters are dedicated to manipulation of numerical data.

Significant input/output routines are carefully explained, and a potpourri of miscellaneous Level II subroutines is also covered. If you are looking for a list of the tokens used by BASIC, they are in this book; you'll discover the easiest ways to send text to the screen, get a string of characters from the keyboard and produce text on a printer. With each and every routine that has a link to the disk system there is a boldface paragraph marked "Disk System Caution".

Part Two of Inside Level II applies the material from Part One, encompassing assemblers and monitors, relocating BASIC programs, VARPTR use, BASIC-assembler program linking, expansion of USR calls from one to ten, linking multiple program segments and tape load/save. The book concludes with sample composite (BASIC/assembly) programs and tape utilities to CSAVE/CLOAD composite programs at speeds higher than $\mathbf{5 0 0}$ baud.

Typical program samples include preliminary comments, fully annotated source code, line by line explanations and descriptive notes. Notwithstanding the detail and careful illustration, Inside is by no means an easy book. We've all heard by now from the purveyors of instant solutions the problems of learning machine language. There are no tricks.
Although machine code and assembly language are viewed as drudgery, it's not possible to put shortcuts to work unless we have some idea of how they function. Consider that BASIC is already a kind of black box; sudden death during string sorting is just one example of that. Imagine debugging a BASIC program full of ROM subroutines-it's a shortcut to madness! Blattner and Mumford say it bluntly: "To take full advantage of the information in this book requires a knowledge of Z-80 assembly language programming."
It should be noted that Level II is undergoing some change and improvement, and newer TRS owners will enjoy better performance from their computers. Lest these alterations should cause some nervousness about the reliability of books like Inside Level II, let me mention that the changes being made in Level II are, for the most part, refinements and therefore will have little effect on major subroutines. Some change is made on cassette loading and saving, and a few bugs (remember POKE 16553,255 ?) have disappeared. The new edition of Supermap from Fuller Software indicates the differences between new and old Level II ROMs.

## TRS 232 Formatter

Small Systems Software
Newbury Park, CA
$\$ 14.95$

## by Hugo T. Jackson

4 ven before I ordered the TRS 232 Printer Interface from Small System Software, I could tell from the description in the advertisement that 1 would not be happy with the available software needed to run it.
When compared with the rather impressive features of their TRS 232 Formatter program, it was obvious that the software sent free with the interface unit was just a bare bones program. As a cautionary measure, I order the Formatter program at the same time I ordered the equipment.
Because the supplied program makes no at-
tempt to monitor line lengths, the first program 1 tried to run ended unsuccessfully. My printer output the first line of data until it reached the end of its carriage, where it stayed, typing letter over letter, until my program had kicked out what it considered to be the last character in the line. So much for the free software!

## Getting There From Here

The Formatter program comes complete with a seventeen-page comprehensive manual which serves as an example of how documentation should be presented. After listing all the available options, along with a brief description of each, it details the loading procedures and memory size requirements for the program.

Having studied the manual, I reset my computer, set the memory size as required and loaded the Formatter (which is a BASIC program). When you type run, the program POKEs the machine language program into high memory
and cycles through the various options. It modifies the machine language program now in memory to reflect your choices. You can then delete the Formatter program and load or run any of your own programs.
What options are available to you? First of all, the Formatter supports nearly every baud rate I've ever heard of, and even if your printer doesn't accept one of the ten available, the manual describes how to modify the program in order to create non-standard baud rates.
If your printer requires a line feed after a carriage return, the Formatter generates one automatically. If your printer recognizes form feeds, it also generates these instead of a number of carriage returns or line feeds, to get you to the top of a new page. Needless to say, if it can execute line feeds, this saves your machine a fair amount of wear and tear.
One of the best features of the Formatter program is that it allows you to set the maximum line length. If the program you are running exceeds the maximum chosen, the Formatter automatically generates a carriage return (and line feed if needed), carrying the remainder of the text onto the next line.

## The Early Line Option

Another great feature of the program is the "Line Length For Early Line Termination."

Say you have a line in your program that is eighty characters long. As your printer has only a seventy-column carriage, you have asked for a line length of seventy.
But what if the last word in the line being printed is microcomputing? Normally, micr would appear at the end of the line and the remaining letters on the following line.

By taking advantage of the early line option and requesting an "intelligent" termination at sixty characters, the Formatter program begins testing every character from sixty onwards until it finds a space, comma, colon or semi-colon. If and when it does, the program ends the line at that point, generates a carriage return, tabs inward five spaces and prints the remainder of the line. This makes for more readable listings.
If your printer requires nulls before it accepts any more characters, the Formatter sends up to 127 nulls after a carriage return before it con-

tinues sending text to the printer.
You can also set the number of lines to appear on each page, as well as the number of spaces to appear between pages. This cures many headaches, as I used to waste plenty of paper trying to prevent my printer from printing lines on the perforations of the paper.

High on the list of program features is the option which directs the Formatter to print the same information it is sending to the printer on the video monitor.

If you have disks and can't see yourself giving them to me, you should take advantage of the next option, which disables interrupts from the disk controller. If you don't, any generated interrupt destroys the baud rate timing loops in the Formatter program, and the result is garbage.

## Additional Features

The Formatter program even inserts an automatic keyboard debounce routine. To top it off, there are four special features, well worth the purchase price in their own right:

To stop printing for any reason, you need only press the space bar. After that, you can print a single line at a time by repeatedly pushing the space bar. To return to uninterrupted printing, push any other key.

If the program isn't printing properly, or you
typed LLIST inadvertently, you can stop the listing and return to BASIC simply by pressing the break key. No more keyboard lockup!
If you requested the keyboard debounce routine, you also can use the clear key to reset the lines per page counter, insuring that all your listings start at the top of the page. If you didn't request the keyboard debounce routine, you can still reset the line counter by typing LPRINT CHRS(3).
The Formatter also sends to the printer any material that is being printed on the screen (barring graphics, of course). Now 1 can use the TRON and TROFF functions of Level II BASIC intelligently.
While they are great features, I am sure you'll agree that the line numbers just zip by too quickly to be of any practical use. Using this feature, I can now get a permanent record of where my programs have been wandering. This option is enabled by executing LPRINT CHRS(1) and disabled by typing LPRINT CHRS(2).

## Biting the Hand That Feeds

My only complaint about the Formatter program is that you cannot set a left-hand margin. Admittedly, for such a great program, this is a small point, but I do wonder why it didn't occur to them.

## Inseq-80 and Insort-80 <br> S\&M Systems, Inc. <br> Marlboro, MA <br> TRS-80 32 and 48K Disk <br> $\$ 49.95$

## by Dennis Thuriow

As the darkness slowly parts and the mysteries that have so long enshrouded the TRS-80 disk are revealed, more and more good utility packages are finding their way to market. These packages tend to be for the software developer rather than the end-user as they require a working knowledge of disk formats and machine language routines. Inseq and Insort are no exception to the rule.

The "buy-me" on the cover of the S\&M package says, "A must for anyone writing business programs." At best this is an understatement. These routines are so fundamental to the handling of disk files it's hard to understand why Microsoft didn't include them in the Disk BASIC.

Inseq uses six variables, two of which are subscripted, and four string variables, two of which are also subscripted, as well as USER functions one through six. Two invisible bytes are also added to each file.

## Same Variables

Insort uses the same variables and memory that must be protected when BASIC is entered. It uses USER7 temporarily. Both programs were written to work with NEWDOS or VTOS. (If you have TRSDOS, you have to do a little rewriting.) The rewrites are well documented. The only thing that might be called a bug is that
neither system will allow you to specify a drive for files you are creating, unless the file name has an extension.
The Indexed Sequential Access Method loads into high memory before BASIC is entered and the controlling BASIC program is built by another BASIC program on the disk. You may also access the functions by USER calls from your own program if you don't want to use theirs. You can read files sequentially, or refer to them by an index for reading, writing or deleting. A housekeeping function makes sure all files are closed and parameters are reset. A Data Base Utility allows you to convert already existing files to indexed sequential ones, lets you set up empty files to fill later, create a file by key from another file, and purge and reorganize files on a single disk system.
Insort allows ascending and descending sorts for ASCII or numeric fields. Any record length up to 255 is supported; keys can be any length up to full record size; sorts can be done on as many keys as memory will allow. The number generally falls between 36 and 40 . A BASIC program can be generated to make the calls for you, or you can call them yourself with USER. The generated program allows you to make up to five CMD calls and/or automatically call up the next BASIC program from disk.
Sort times are admirable: 3000 files with 10 character keys can be sorted in 17 minutes, 50 files in 35 seconds. The screen constantly tells you how the sort is progressing.

Both utilities have extensive error trapping and flagging. Both are easy to use after a little practice with the demonstration files provided on the disk. For TRS-80 data file processing. both are a must!

## CP/M ${ }^{\text {¹ }}$ - based Business Software for TRS- $80^{02}$ computers on . . . . . . the fastest Mod-II CP/M with the most features!!!

- Over 610,000 bytes/disk
- Downloading package included
- 1,200 baud operation of serial printers without data loss
- Single drive backup

MOD-II CP/M
$\$ 250.00$

- Mixed single/double density on any of 4 drives (even a 1 -drive system)
- Ulitra-fast disk operation
- Emulation of cursor addressing for any of several "dumb" CRTs
MOD-I CP/M

The following software for Mod-II CP/M only unless otherwise stated (*-requires CBASIC2)

RM/COBOL ${ }^{04}$ - Only COBOL for CP/M with alternate keys (multikey ISAM), CRT screen handling, interactive debug, Z80 code, and the most useful Level 2 features. Compatible with Tandy's COBOL-but runs faster! . $\$ 495.00$
PMS (Property Management System) - Interactive, menu-driven system includes full $\mathrm{G} / \mathrm{L}$, budgeting, cash juurnal, delinquency list, tenant activity/rent roll, complete audit trail and reports on vacancies, lost rent, and vendors $\qquad$ \$650.00* $75.00^{*}$ APH (Automated Patient History) - General-purpose questionasking, answer-printing system furnished as self-administered review-of-systems general patient history (Mod-I also) ... \$175.00*

MAGIC WAND ${ }^{55}$ - Full-feature word processing, true proportional spacing, file merging, and use of full-screen editor for source programs or data RPA(Residential Prop financing taxes, inflation and depreciation on hoand expe apartments over a user-selectable time. Shows payoff in terms of ROI, Cap rate, cash-on-cash. Amortization schedules and worksheet

Micro Music<br>Radio Shack<br>Tandy Corporation<br>Ft. Worth, TX<br>$\$ 9.95$

by Allan S. Joffe

NTothing is forever. You have just played your tenth version of Star Trek and relaxed with a binary to hex program. Now the blahs have set in. The sure cure is to treat yourself to a cassette of Micro Music by Radio Shack.
This package gives you musical notes including sharps, flats and naturals over five octaves.
You control the music's tempo with rests, tremolos, triplets and staccato notes. There are also a number of voice modifying commands that change the timbre of the music.

## Innovations

The documentation is adequate, but, as usual, it leaves out some surprises, which prove that Murphy will never be forced to the unemployment office while computers exist. For example, if you program a trill as (9TA8B8A8B8), it will trill nicely for about two seconds. If you accidentally leave a space between the opening parenthesis and the 9 , the trill will last for about 40 seconds.
If you enter ((9TA8B8A8B8))-adding an opening parenthesis and an additional closing parenthesis-the program goes on forever unless you break it by holding down one of the arrow keys.
You can turn this bit of adversity into serendipity by trying the following program: ( 9 9TC4R8C4R8C4R8CR8)). When you play this, the result is a Morse code V that will go on forever. This is a simple way to make a $\mathbf{V}$-test tape, if that has been the missing element between you and happiness.
If you would like a snappier V , you can change the expression as follows: ((9TC8R8C8R8C8R8C2R8)), and if you want to change the tone of the V , you can insert one of the tone modifiers such as $\mathrm{L}, \mathrm{Y}$ or Z between the 9 and the T .
the screen!
With careful keyboard work, some study and the ability to read music, you can enjoy this fine extension of your TRS-80 and Tandy's never-ending fight to educate, instruct and, now, amuse.
The sample listing in the documentation is a
real tour de force presentation of the "Flight of the Bumblebee." It's well worth the effort to key it in and then play with the tone modifiers, particularly the Z modifier. If you are old enough, it will bring back memories of the "Green Hornet."

## Micro-opoly

D. Perrin

Level IV Products, Inc.
Livonia, MI

## By Alan and Nick Grassel

0ne of the nice things about computer games is that they usually eliminate the aggravating paper shuffling and bookkeeping that take the fun out of a game.
With Micro-opoly you get the added bonus of an honest banker. It is written in BASIC for TRS-80 Level II with at least 16 K .
The single sheet of typeset instructions, will not answer all of your questions about the games operation.
As it stands, if the computer wins the roll of the dice, and goes first, you will probably find yourself shouting, "Whoa, wait a minute!" You can figure out what's happening, but it was the job of the program author to delineate this in his instructions.
The program and documentation also assume you already have an understanding of the board game Monopoly.
Your answers are entered through INKEYS. The H command is to access the information displays. The computer can either display a specific property you request or it can display a rundown of both opponents' holdings. You can use these information displays to help you plan strategy.
New zoning ordinances were passed for this game. You do not need to own all the property in a color sequence to build on any square you own, except railroad or utility.
Though the computer is limited to buying houses for only one property at a time, you can
buy up to four houses or a hotel for as many squares as your bankroll will allow. This is a cash-only society. No credit allowed.

If you land on computer property, you'll have to pay rent. The computer displays "YOU LANDED ON ( name)" and it flashes the property name. Then it displays "THAT COSTS YOU ( $\$$ )".

If you are forced into a negative cash situation by any payments the computer requires you to sell houses or hotels until you have a positive cash balance. You also have the option of continuing to sell property until you have sufficient cash on hand to feel safe.

## Programming Differences

There's a little programming quirk involved in the property purchasing which should be explained here. To add houses, enter the number you wish to add. To upgrade to a hotel, you must enter 5 , although four houses plus one equals a hotel in Monopoly.

Other rule departures from the Parker Brothers' board game, Monopoly, require automatic and immediate payments when you land in jail; houses are sold back to the bank for full price (not half price); rolling doubles three times in a row will not send you to jail; you cannot sell or trade property squares; there is no Get Out of Jail Free card; and Free Parking is the repository of all funds which normally go to Poor Tax, Hospital Bills, etc. The first player to land on Free Parking gets the money as a bonus.

Purists will decry the changes, but for the most part it leads to an interesting game with a reasonable time frame. And there's no arguing about who picks up the game and puts it away.

## Limitations

If your musical selections act peculiar or even weird, look out for inadvertent spaces after opening parenthesis and, the worst offender of all, an accidentally inserted closing parenthesis. This latter beast will usually cause a slow tempo, a batch of notes that you know you did not insert into the original effort.

If you have to interrupt the program while it is playing, use the right arrow key only. If you lose sight of the blinking asterisk, which is your location guide on the screen, find it by using the up arrow key only. Using the down arrow key to locate a missing cursor generally results in having to reload the system cassette.

There is another limitation worth mentioning. You do not have unlimited space to write your song. You have exactly 16 full lines of characters before you start writing over the top line. This is only destructive if you are busy transcribing a Bach fugue and forget to watch

Model 440 Paper Tiger
Integral Data Systems, Inc.
Natick, MA
$\mathbf{S 9 9 5}$ standard printer
S1094 with graphic option
by James H. Sheats

When it became obvious that my printer was inadequate, I started looking for a new one. Naturally, I wanted as good a printer as possibie. Dealers whom I asked declared that Integral Data Systems' Brighter Writers had performed satisfactorily with only minor breakdowns. They recommended the IDS Model 440 Paper Tiger.

## Removable Case

The Tiger has an attractive, removable molded plastic case. It can be removed by twisting four knurled retainer nuts.

All of the controls are reached through cuts in the plastic case or are mounted on the metal back plate of the printer. A fuse socket, a 115 $\mathrm{V}-230 \mathrm{~V}$ selector switch and the main power switch are all found on the back plate. There are no unguarded openings, so even a clumsy fellow like me can reach behind the printer for the switch with relative safety.
In the top of the case on the right are the offline/online switch and a form feed/line feed switch. The printer must be offline while the "self-test" is administered or any form feed adjustments are made. On the left side of the tractor are the formset/test switch and two banks of seven DIP switches.
The right position of the formset/test switch is the self-test pattern. As long as the switch is held to the right, the printer prints full line lengths of the 96 ASCII characters at the selected print density. This part of the self-test also helps the user align the paper.

## Maillist

DAR Sales
Sacramento, CA 95812
$\mathbf{\$ 3 9 . 9 5}$
by Chris Brown
80 Staff

There you sit with a substantial investment in computer hardware, wondering how to make it pay its share of the rent. Everyone tells you it's easy to get rich using computers, but nobody you know is close to breaking even. Then, along comes Richard Alva from DAR sales.

He says you can make some bucks with your machine by providing a service sorely needed in your community. This service involves performing a rather simple, but dreary task, generating mailing labels.

## Ideal computer stuff, eh?

With DAR software and Alva's business tutelage, you will be able to establish and maintain mail lists for local businesses and organization. The result: instant money for you and your computer. Sound too good to be true? Maybe it is, since the success is in the selling, and Richard Alva leaves that to you.

## Alva Has a Better Idea

Richard Alva has had a better idea. Instead of going through the hassle of selling his software directly to users, he has gone a step further and produced a business package for computerists. It is up to them to find and then sell their users.
The package is called Maillist and comes with software documentation and 100 promo-

tional letters. Alva's intention is that these will be used to drum up interest in the service. He even includes an instruction manual detailing how to set up your business.
The author has calculated the costs involved in supplying the service and offers a suggested price list: ten cents for entering a three-line name and address; add three cents if a special code is used; add five cents if remarks are entered, etc.

You say you haven't got a printer? Well, don't worry. Richard Alva has thought of that too. Just copy your data tapes or disks and send them to DAR. For a nominal fee (three cents per label), Alva will do the printing for you. The same is true for sorting. Normal program sort priority is by zip code but, if necessary, DAR will sort your data in other formats. Again, for a nominal fee.

## The Software

The program cassette supplied has two program dumps. The first is a 32 K , disk-based version of Maillist, the second is a 16 K tape-based version. The disk version requires only one drive and most of the additional memory required for the disk version is taken up by operating system instructions.
The Maillist program creates three files on a disk. Each file is capable of holding up to 125 names and addresses, and entries are coded to the disks. Each disk can hold 375 entries. The user manual provides detailed instructions for opening, changing and deleting entries in the files. The step-by-step intructions seem clear enough for the most novice of operators.
A file sort time in the standard zip code format takes only 15 minutes, according to Alva.
If you think you have a knack for selling and want to get a sideline going, DAR's Maillist package can give you a start. It comes with a 30-day, money back guarantee, if not fully satisfied, and a promise from Richard Alva that you will earn at least ten dollars an hour for your trouble. If he can sell you, maybe you can sell too.

Part of the self-test is supposed to occur automatically upon power up. Spontaneously printed characters presumably indicate a malfunction.
Both paper tractors are continuously adjustable, so odd-sized paper widths can be handled, as well as the more common widths, up to a maximum of nine and one-half inches. A paper roll holder is available as an option.
Two sets of DIP switches control the remaining adjustable features of the printer. Though plainly marked, they are small and close together, and you might easily move more than one switch at a time.
Switches one and two on the left bank control the adjustable print sizes-8.3, 10, 12 and 16.5 characters per inch. The print line is eight inches long, making the line length $66,80,96$ or 132 characters, respectively. The printer ignores changes in these two DIP switches, unless the main power switch is turned off. It is probably a good idea to turn off the main power switch while reconfiguring any of the DIP switches.
Switch three selects an eight-line per inch or a six-line per inch vertical spacing. Letters and normal printing can be at six lines per inch, while manuscripts and other matter requiring double spacing can be printed at eight lines per inch to make them less wasteful of paper.

Switch four enables or disables a one-inch skip at form boundaries. I have found this feature useful for program listings.

Switch five enables or disables an automatic line feed with carriage returns. If a TRS-80 program was originally written for a printer without an automatic line feed, the necessary line feeds were probably incorporated in the program, and this switch must be disabled. The Electric Pencil definitely requires that this switch be off.

The Paper Tiger utilizes a $7 \times 7$ dot matrix with upper and lowercase letters. Its speed varies with character size, but is in the $50-100$ characters per second range. This is fast enough for most hobby use.

## No Mechanical Fallures

Overall mechanical performance of my Paper Tiger is excellent. I have had no mechanical breakdowns that required service.

1 have had certain software problems operating the Tiger in conjunction with my TRS-80, though. I found out that TAB characters do not work past the 63rd character in a printer line. There are, of course, programming alternatives to the TAB command.

Once my Tiger hung up on a program listing. The BASIC line that caused the trouble was a long, multi-statement one. I simply broke the line into several lines of BASIC and had no more trouble of this nature.

## TRS-80* OWNERS:

- Let the computer write your "Basic"
program for you! - Draw pictures, animated figures, data forms!
- Create a library of display forms!
- Produce "Commercial" gradesoftware!

The Magic Cursor is a Revolutionary Family of Products which provides a dramatic new method of reproducing drawings and displays that you create on your screen. It makes both simple displays and complex interactive data input forms. It stores a "BASIC PROGRAM" on disk (or tape) ready for you to execute alone or as a subroutine. It produces screens in both standard or wide screen.

It is available for any level $\mathbf{2 , 1 6 K}$ or larger system with tape or disk. An optional version is now available which creates an assembly language program.

Be sure to pick out the system that fits your present needs and order it today. You may upgrade your original copy by paying the difference and a moderate service charge.

## MAGIC CURSOR PROGRAMS

THE MAGIC CURSOR allows you to easily create screens (including graphics) on your video. A powerful command then generates the BASIC instructions to recreate the screen. For the first time, a program for automatic generation of video display forms. (16K Tape or Disk)

THE MAGIC CURSOR I additionally makes sophisticated Data Entry and Display easy. With Magic Cursor I you define the Data Entry or Display fields directly on your screen. The definition commands generate the BASIC instructions to implement the Data Entry and Display. The Magic Cursor I has commands which move, center, and duplicate blocks of graphical or alpha/numeric displays. You can even justify text. (16K Tape Only) ...................................... $\$ 79.95$

THE MAGIC CURSOR II adds the power to write animated games easily in BASIC. The Magic Cursor II allows you to reload previous screens either from memory or from Disk. You can then modify them and store either the modified screen or only the changes. ( 32 K Disk Only)
. 999.95
THE MAGIC CURSOR III will be available soon for the new Model II Computer (32K One or more Disk) ................................ \$149.95

THE MAGIC CURSOR IV provides the features of Magic Cursor II but stores an assembly language program. (32K Disk Only) ..... \$99.95

## NEW RELEASES FROM CCC!!!

## Now available for the first time!!!!! A Monitor/Trace program with versions for both Model I and Model II.

## Trace-80 ${ }^{\text {Tw }}$

TRACE-80 lets you observe the inner working of a machine language program. It allows you to run a machine language program in slow motion and watch the screen. You can stop execution at any time and examine the current instruction mnemonic and all register contents. You can execute your program and watch each instruction mnemonic and register contents list to the screen in place of normal screen display.

If you have a printer. TRACE-80 allows you to execute your program in slow motion and watch the screen while your printer simultaneously prints the machine code being executed, the memory location and the instruction mnemonic along with the current register contents.

You can execute a machine language program in slow motion, freeze the action, examine and/or change memory, examine and/or change register contents and then continue the slow motion. You can speed up past common routines and slow down to examine other routines in detail or operate in single step mode.

TRACE-80 allows you to trace ROM as well as RAM because instructions are emulated in a special execution buffer.
FEATURES:

* For both beginner and advanced programmer
* More than 20 commands.
* Trace-80 is written in machine language.
* Traces both ROM and RAM.
* Level II or Mod I Disk operation.
* Model II Disk version available.
* Optionally prints only "Transfer and Control" instructions
* Full speed, slow speed or freeze execution modes.
* Memory can be displayed/modified.
* Register contents can be displayed/modified.
* Hex. ASCII and mnemonic display modes.
* Abreviated or full printer format.
* Serial printer output if desired.
* Option of normal screen display, memory display, trace display or clear screen.
* Learn assembly language programming as well as machine coding by watching actual code execution and see assembly language mnemonic
PARTIAL LIST OF COMMANDS: Load disk file, Trace, Slow Motion Execution, Full Speed Execution, Freeze Action, Single Instruction Execution, Examine and/or Display memory, Examine and/or Display Register Contents, Enable/Disable Screen, Enable/Disable Printer, Ascii or Hex Display. Full Screen Memory Display, Line Printer Commands, etc.
TRACE-80/MOD-I (for Level II or DOS operation) ............ $\$ 29.95$ Supplied on tape with 3 versions ( $16 \mathrm{~K}, 32 \mathrm{~K}$ or 48 K ). Complete with instructions
TRACE-80/MOD-II
$\$ 49.95$

## The Restauranteur's Consultant by Ty Halderman

This food and beverage management tool dramatically reduces the human factors in food cost analysis. Those tasks required to effectively operate any restaurant or food service business. Over a half dozen reports give uniform, accurate and up to the minute information for profitability. And, handling of daily cost changes requires only minutes per week instead of hours, because the Consultant makes all the necessary conversions from your case prices. Reports include.

1. Menu Recipes.
2. Food Cost Summary
3. Ingredient Listing.
4. Input Data Sheets
5. Supplier Master File.
6. Batch Update.
7. Complete Listing of Food Cost Analysis.

Mod 1, 32K. 2 Disk, Printer or Mod 2
\$750.00

[^1]

The new computers are showing off.
Over $\$ 50$ million worth of equipment in over 100,000
square feet of space, including the latest software and hardware for business, government, home and personal use. Everything the NCC show has and more will be on display, and you can buy it all right on the spot.

Computers costing $\$ 150$ to $\$ 250,000$, mini and micro computers, data- and word-processing equipment, telecommunications, office machines, peripheral equipment and services from leading names in the industry like IBM, Xerox, Radio Shack and Apple will all be there.

There'll be conferences on business uses of small to medium sized computers, and how to make purchasing evaluations.

There'll be robots, computerized video games, computer art and computer music.

Everyone from kids to people who earn their living with computers will have a great time at the largest computer show ever organized in each region.

Admission for adults is $\$ 5$. The public is invited, and no pre-registration is necessary

DB-9500 Line Printer
Anadex, Inc.
Chatsworth, CA 91311
S1650 Model I Compatible
by Edward E. Umlor

TThe DB-9500 is one of the better designs among dot matrix printers on the market. Some of its features include:

- I/O Parallel, serial and current loop interfaces, all built in;
- Type: two fonts available (normal size $9 \times 9$ and condensed size $7 \times 9$ ) for 10,12 and 13.3 characters per inch, and six or eight lines per inch (double width format is also available in both fonts);
- Speed: from 150 CPS to 200 CPS, depending on type selected;
$\bullet$ Paper: 1.75 to 16.875 inch, edge punched, single weight from 15 to 100 , or multipart thickness of 0.018 inches maximum;
- Ribbon: enclosed cartridge;
- Graphics: individual dot addressable in $7 \times 1$ format (each character is one dot wide and 0-7 dots high.
All parameters (except I/O format) are software selectable as well as switch selectable. The DB-9500, selected for parallel (Centronics format) operation, was hooked up to our TRS-80 word-processing system and fired up. The printer performed correctly on the first run. The printer ready line prevents data from going to the printer prematurely so that all characters are printed. We had the 2 K optional RAM installed for a total of 2.7 K FIFO buffer.

The print quality is very good in both fonts and is crisp and clear. The lever with detent stops at the left side of the carriage controls the distance of the print head from the platen. Set the lever for maximum separation to load the paper more easily and then set it back for the correct impact pressure. This is a much better arrangement than the fixed gap method used by most printers.

Its operation is almost flawless. We were running a mail list on our MSI computer, with the perforation skip set at one inch. On each new page, the top two lines did not have the correct separation. This might have been caused by paper drag as the paper came out of its box. When half an inch skip setting was used, there wasn't a problem with paging.

Microline-80
Okidata
Mount Laurel, NJ
$\$ 800$
by Gary L. Osburn

1was recently faced with the $\$ 64$ question (or in this case, the $\$ 1000$ question): Out of the dozens of printers available for use with the TRS-80, which one would be the best for me? I was infected with the micro-bug about two years ago and found that the only treatment was massive doses of Z-80! When I decided to take the plunge, the lack of ready cash meant that the habit had to be self-supporting. I started a small consulting service for developing custom software and needed a printer that emulated any of several printers that my clients were using. The printer had to look like it printed 40,80 or 132 columns.

## The Okidata

At the National Computer Conference in Anaheim I found an Okidata display. In one corner of the display was a sleek little box sitting on a pedestal spitting out fact sheets at 80 cps . I thought it particularly effective to have the printer printing its own specifications.
The printer is impressively small. Its vital statistics are 13.4 inches wide $\times 9.4$ inches deep $\times 4$ inches high. Apparently the trick to producing such a small printer is the low mass print head. Energy is stored in tension members waiting to fire extremely hard print pins on de-
mand. This translates into low heat and longer life. The company is so sure of the longer life that it guarantees the print head for $2,000,000$ characters.

The printer produces 162 lines per minute ( 80 column format) and can print either six or eight lines to the inch. This can be a real paper saver!

Extremely clear characters are printed in a $9 \times 7$ dot matrix. The character set is the ASCII standard 96 characters (upper and lowercase) and features block graphics! This capability allows for all sorts of clever printing possibilities. (See Table 1.)

The printer comes standard with friction and pin feed (ten-inch pins). A tractor drive mechanism is available for $\$ 140$ and simply snaps into place when it is needed. It can be removed when it is not.

You can use the inexpensive roll paper for most of your work, and still have the tractor when needed. Incidentally, standard Teletype paper available at most office supply shops is a lot cheaper than what Radio Shack sells.

Speaking of supplies, the Microline-80 uses a standard two-inch typewriter ribbon that you can pick up almost anywhere for less than two bucks!

Using the Microline- 80 is a real dream. There were no installation problems whatsoever, the ribbon connector sent with the unit fit perfectly, and the connection pins required no rewiring. The quality of the print really helps when looking for that hard to find bug. Though the lowercase letters do not have below the line descenders, the print is definitely of letter quality. Consider the Microline-80.

# "The scheme for creating one large program with EDTASM/ Apparat is to keep adding source code lines as required." 

This month we'll be discussing editor/ assemblers for the Model I and II and more about SET/RESET.

Radio Shack's Disk Editor/Assembler, a macro assembler that produces relocatable modules, differs from EDTASM, the cassette based Radio Shack Assembler and from the Apparat version of EDTASM, in the following areas:

1. It produces relocatable object modules that must be "linked-loaded."
2. It allows some limited macro capability.
3. It has some format differences in the pseudo-op area.
4. It allows some additional pseudo operations relating to titling, page formatting, and so forth.
The assembler does basically the same job as the Apparat assembler, taking a source assembly program in standard Z-80 mnemonics and translating it into object code, operating with disk files for source and object. A source program for the disk assembler will look virtually identical to one for EDTASM or the Apparat assembler. The difference lies mainly in how it goes about producing the source code.

## Relocatable Modules vs. One Program

The scheme for creating one large program with EDTASM/Apparat is to keep adding source code lines as required. Within the source code, you can structure separate program modules. A large assembly language program would probably have many separate subroutines with defined inputs and outputs, and several levels of routines, as shown in Fig. 1.
All the code, however, would be within one source file. There would be no problem referencing a label in one part of the program from another part, as the assembler would have built up a symbol table of all labels used in the program.
This scheme of one huge program is fine except for two gremlins, memory size and divisibility.
As RAM is being used to hold the source code and the symbol table, there is a limit to the size of the program that can be assembled. This limit is a function of the number of lines of source code, size of the lines, and number of labels used. I've reached the limit in about 1000 source lines with a lot of comments and a lot of symbols (it's terrible programming practice to have "JP \$ + 257"!). Memory size, therefore, may be a problem for large programs.
The second gremlin, divisibility, requires some explanation. How do you divide a program when you run out of memory and you have a huge program that is crisscrossed with references? What about a large programming
task that must be split up among several programmers? How do they write code that can be merged together efficiently?
Assemblers that produced relocatable object modules were developed in the early days of programming to get rid of the twin gremlins of limited memory size and divisibility. The Disk Editor/Assembler allows a large program to be broken up into as many modules as desired.

In this type of assembler, each source code module is assembled after the edit to produce a relocatable object code module. Why relocatable? Obviously, it would be difficult to assign absolute addresses for each object module, as the sizes are variable. Each module is relocated at load time by automatically adding a relocation bias to the addresses and other relocatable data types.

Intermodule communication is handled by EXTernal and ENTR Y peudo-ops. If a label is declared as an ENTRY, other modules may reference the label, provided they have declared a corresponding EXT for the name of the label. These labels are referred to as global, because they are accessible to all modules, rather than just locally, inside of one module.
To see how this process of assembling, loading and linking works, see Program Listing 1 , which shows a huge program of three modules.

Module one is the main module, typically the driver program. In this case MAIN looks for a keypress of 0-7, prints the key and loops back for the next keypress. MAIN references two other modules, KEY and PRINT. KEY is a subroutine to detect a keypress and PRINT prints the value of the keypress at the screen center.
Note the EXT for KEY and PRINT in MAIN and the corresponding ENTRY pseudoops in KEY and PRINT. Of course, all modules
may have both ENTRYs and EXTs, depending on the references.
The commands to the loader to load MAIN, KEY, and PRINT from disk as object modules and to write the subsequent core image out as PROG is given in Program Listing 2. PROG can be loaded and executed as a single CMD type file from disk.

## Wholly Macro! Look at This Feature!

A second feature of the Disk Editor/ Assembler is its ability to define and use macros. A macro in its simplest form is nothing more than a specified set of instructions that is spewed out at assembly time when the macro name is invoked. Suppose, for example, that we used the sequence of instructions

| LD | HL.BUFFR |
| :--- | :--- |
| LD | DE,DCB |
| LD | B,0 |
| CALL | $\mathbf{4 4 2 4 H}$ |

several times in program to OPEN a TRSDOS disk file. Rather than writing the four instructions for assembly each time we open a disk file, we can define the instructions as a macro called OPEN. The MACRO pseudo-op defines the label as a macro name, and the code between the MACRO and ENDM defines the body of the macro. Having defined the macro at the beginning of the assembly language source code (Program Listing 3), we can now invoke the macro (OPEN), automatically generating the four instructions, at any point in the source code.
Not only does the assembler allow us to define sets of instructions as macros, it allows us to use general arguments as parameters for macro calls. In Listing 3, we don't always want to use BUFFR as the buffer; we might want to

Program Listing 1. Typical Relocatable Modules

Program Listing 3. Simple Macro.
use BUFFR1 or BUFFR2. By defining dummy arguments in the macro definition, a macro will utilize a given set of arguments everytime it's invoked. Program Listing 4 shows three arguments, BUFFER, DCB and LRL, as dummies in the macro definition. When the OPEN macro is invoked, the arguments specified are then substituted for the dummy as shown.

Macros can be used to simplify calls to subroutines or system functions-as they are on large computers-or to automatically generate a set of in-line code, or even to define a special assembly-time interpretive language.

## Format Differences

The Disk Editor/Assembler has some minor format differences from EDTASM. Labels on assembly source lines must be suffixed by a colon. The pseudo-ops for defining bytes; words, storage and strings are either DEFB, DEFW, DEFS and DEFM or an alternate (8080) set of DB, DW, DS and DC. One of the nicest differences in these pseudo-ops are that multiple arguments can be used as in DB $2,5,45,6,77$.

The editor uses similar, but not identical, commands to the BASIC/EDTASM editor;
the commands are not quite as powerful as in EDTASM. An edit is performed on a disk file. At the completion of an edit, the modified file is written out to disk as a new file name. The old file name cannot be used, necessitating a KILL followed by a RENAME to complete the edit of a source file.
Some additional pseudo-ops in the Disk Editor/Assembler allow listing format control and conditional assembly. Those in the first group are such commands as TITLE, SUBTTL (subtitle), PAGE and .COMMENT. Listing can be selectively controlled for various parts of the program. Conditional assembly is controlled by pseudo-ops such as IFT (if true) and ENDIF. Other functions, such as repeat (REPT) code, are also permitted. All in all, the commands incorporated into the Disk Editor/Assembler are similar to the commands one sees in assemblers on most minicomputer systems.

## Which Assembler is Best?

Which assembler, EDTASM/Apparat or the Radio Shack Disk Editor/Assembler, is "best'? Unfortunately, an assembly language

```
DOS READY
L80
(Loads Loader)
-.P: 8000 (Sets load location to 8000 H )
-MAIN, KEY, PRINT (Loads MAIN, KEY, PRINT
DATA 8000, 802F in that order)
DATA 8000 802F (Program boundaries)
-TEST-N,-E (File TEST/CMD, end load)
(0000 802F)
DOS READY
Program Listing 2. Typical Load Sequence
```

programmer is almost forced to choose one or the other, because of minor format differences between the two. This is really a lamentable condition; it's a shame that colon in labels wasn't exorcised.

The Disk Assembler got short shrift in an earlier column. After using it extensively however, I've formed the following opinions:
> '"Which assembler, . . . is 'best'? Unfortunately, . . . a programmer is almost forced to choose one or the other, because of minor format differences. . .

- If the TRS-80 is used in a programming department in a commercial company, the best choice of assemblers is probably the Disk. It provides all the features of EDTASM/ Apparat and with its Modular flexibility can maintain and develop large program packages.
- If you do a great deal of assembly language programming or want to use the best tools available, then the Disk Editor/ Assembler again is probably most useful.
- If you are learning assembly language programming or do most of your assembly language programming in short code segments, then stick with EDTASM/Apparat or the new Microsoft version of EDTASM, EDTASMPLUS (cassette based).
These, are my personal opinions, but I'd be interested in hearing yours. (By the way, I'd also be interested in hearing your opinions about the content of this column: Should it be at a lower level, higher level, oriented towards ROM calls, more tutorial, more product oriented? Please let me know.)

## Model II Assemblers

Disregarding assemblers that run in a CP/M (Control Program for Microcomputers) envir-

## THE ASSEMBIY LINE

onment on the Model II, there are at least three others which will run on that computer.
The first is the Radio Shack Macro Assembler. This is a rewrite of Microsoft's Disk Assembler for the Model I and has all of the same features that we discussed in the earlier part of this article. The cost is $\$ 199$.
The second is from Galactic Software, Ltd. EDAS 4.0 has a text editor identical to the BASIC editor. Though I have not used the product, according to its specifications, all object output can go directly to a disk file or to memory and it executes all TRSDOS commands. Its cost is $\$ 229$.
The third is MACASM from Racet Computes. This is an interesting product, as it is a EDTASM-PLUS modified for the Model II. EDTASM-PLUS is a another Microsoft Assembler, and contains an editor, assembler and debug program all in one package. The editor is basically the same editor which is in EDTASM, but has several new commands, such as Move Block and Copy Block.
The assembler is a macro assembler that can be assembled directly to memory. The Z-BUG portion is a symbolic debugger that performs virtually any useful debug function you can imagine, including referencing of locations by symbolic assembly name. Switching between editing, assembling and debugging is instantaneous, as all three are resident at one time.
MACASM is part of a Mod II Development package that includes SUPERZAP, MACASM and Disassembler and costs $\$ 125$.

## The Continuing Saga of SET, RESET

I received a long letter from Jerald J. Kovacic and William Sit, who collaborated on a fast multiply (see previous column). The multiply was fast, but the mail delivery was not. In Jerald's letter he describes the ROM call for POINT, SET and RESET, which should be of interest to many readers.

Basically, all three calls require that there is an ASCII character string in memory of the form ( $\mathrm{X}, \mathrm{Y}$ ) where X and Y are legitimate column and row numbers of $0-127$ and $0-47$, respectively. Caution! The ASCII string must not contain invalid X or Y values and must have correct syntax, otherwise the following routines will go to a BASIC error processing routine, and. . goodbye assembly language!

For POINT, the call is:
$(\mathrm{HL})=$ pointer to ASCII message of $(\mathrm{X}, \mathrm{Y})$ minus one
CALL 0132 H
(Return with location $4121 \mathrm{H}=0$ if point off, OFFH if point on;
$((H L))=$ pointer to first non-blank following the string $)$
For SET and RESET, the calls are:
$(H L)=$ pointer to ASCII message of (X,Y) CALL 135 H for SET
CALL 0138 H for RESET
(Return with $((\mathrm{HL}))=$ pointer to first non-blank following the string)

How do these CALLs compare to the SET/ RESET routine given in an earlier column? If you recall, we set or reset about 2500 points per second. It appears that these ROM routines allow us to operate on about 140 points per second, not to mention the overhead of setting up a string in ASCII of $\mathbf{X}$ and $\mathbf{Y}$ values. This checks with a tight BASIC SET/RESET loop figure of 122 pixels per second that has somewhat more overhead. The test program used to time it is given in Program Listing 5 .

In past columns I've been reluctant to discuss ROM calls. There are some good reasons for this. Firstly, I question how many modular, well defined routines there are in BASIC. Secondly, problems, such as the one above, can branch out in to cloud-cuckooland. Finally, I think one learns more by writing his own assembly language routines. Comments?

| 8990' |  | 00188 | , test | Program | POR ROM CALL POR | SET/RESE |

## INSIDE 80 <br> from page 10

impressed. I seriously considered-quietlybuying one myself. . . didn't want the boss to know... .but the price/need ratio was still only mildly attractive. The deciding factor in my case might have been one of judgment.
I'm not a digital or computer technician, but I am experienced enough in electronics to understand Murphy's law and its effect on computer hardware compatibility. If you buy two items from the same supplier, you at least have one company you look to for proper interfacing. If they come from different suppliers, about all you can reasonably expect is that each company assure proper operation of their particular item.

Radio Shack has a limited supply of technical types, and we hope it is now obvious what they've been doing since we introduced Model II. From the 1977 introduction of Model I, we've said many times, that we can't offer specialized hardware help or custom programming.
We see other folks' ads for some pretty im-pressive-looking TRS-80 add-ons and software. We haven't had hands on with much of it though, and so we really don't know how to make it play with TRS-80s. Selfishly (we all get that way sometimes), I have to suggest that it might be more reasonable to ask for help from the folks who asked you to buy that product for your TRS-80. Of course, we will support our advertised applications on our equipment.

## 99-cent Catalog

Contrary even to what my friend Wayne Green would have you believe, we don't try to hide our competition from our customers-especially software (his August Remarks). He overlooked our Software Sourcebook, a 99 -cent catalog of over 1,000 "non-Radio Shack" TRS-80 programs. Remember, Wayne, you paid us $\$ 10.00$ each to list seventeen of your own Instant Software programs.
Wayne and I have known each other for close to 20 years now, and I know he won't take offense at a friendly jab, so I'll also chide him a bit for mis-reading his Tandy Annual Report. Our total payroll (not just for our administrative "bureauracy") for operating 7,353 stores worldwide, including six headquarters locations in Fiscal 1979 was about 18 percent of our total expenses rather that the "almost 50 percent" he suggested.
In fact, compared to the top ten computer companies, our sales per employee were second only to IBM.
Be all of that as it may, we members of the bureaucracy will continue to bring you new products, both hardware and software, to the best of our ability. And again, 1 assure you that your comments and suggestions will be met with open arms. As soon as we find the remainder of our management staff-those we're buying for the other 30 percent of our expenses, Wayne-maybe we can offer individual replies.

## with Graphic Display

Here is a new program from Software Etc. . . that is invaluable to any businessman. SAFOR is a time series analysis and forecasting program that will produce presentation quality graphs on your own printer. SAFOR will handle up to ten years of monthly data, provide a comprehensive analysis of past patterns and make both long and short-range forecasts.

SAFOR uses a classical time series decomposition model to provide both tabular and graphic presentations of Original Data, 12 Month Forecasts, Business Cycle, Growth Cycle, Seasonal Pattern and 12 Month Moving Average.

SAFOR can handle any type of data series measured on a monthly basis where no value is zero or less. This data may be in any unit of measure, however

SAFOR does not adjust dollar figures for inflation. The trend is calculated in the same units as actual sales, while other factors are treated as multipliers or indexes. Because the irregular component is unpredictable, SAFOR ignores it.

SAFOR is designed for ease of use, data entry is particularly straightforward, every user action is prompted. The program features extensive editing, updating, data storage and error detection routines.

SAFOR allows for varying levels of expertise in the techniques of analysis, beginner to expert. For the beginner, SAFOR contains standard default operations to help prepare routine analysis and forecasts. For the expert, key assumptions in the program are readily modified without any programming.

SAFOR will run on your TRS-80* Level II with an expansion interface, 32 K of RAM memory, a disk drive, TRSDOS ${ }^{*}$ and optionally a 132 column printer.
Each program comes complete with a two year set of demonstration data. Order yours now! A $\$ 200.00$ value at this Introductory Price of only \$79.95 Good through December 31, 1980 Only.

Software Etc. . .
1839 Chamberlain Drive,
Carrollton, Texas 75007.

# "Machines. . . are defined by their function-and it is the software that determines the function of a general 

# Are Computer Programs Patentable? 

While the industry as a whole clamors for H.R. 6934 (a bill that offers copyright protection for software), a patent granted July 1, 1980 has been overlooked. Patent $4,210,961$ for a sorting system was granted to Whitlow Computer Systems, Inc. of Englewood Cliffs, NJ. The grant was made for "a method. . . of sorting data . . . utilizing a digital computer and at least one random access device. . . ."
Although the patent is specifically for "a method," the sort system is part of Whitlow's software product Syncsort for IBM OS computers. The decision is a coup for all advocates of software patenting.

Currently the U.S. Patent Office is not accepting applications for software or firmware. The Whitlow application was filed prior to the present policy. Thomas Lynch, legal counselor for the Patent Office, explains that judicial decisions have indicated that patents do not apply to computer programs.

## Strong Contingent

However, advocates of software patenting counter that the Patent Office is shirking its duty. This small, but strong contingent is fighting for legal recognition of software programs as inventions, which would make software eligible for patent incentives.
The legality of the Patent Office's stand will be considered by the U.S. Supreme Court when it reconvenes this month. Two programming patent cases will be heard: Diamond, Commissioner of Patents and Trademarks, v. Bradley
and Franklin; and Diamond v. Diehr and Lutton. The first case is a patent appeal for a firmware ROM chip. Diehr and Lutton's appeal is for a software patent.

While the legal debate is fanned in Congress and the courts, it's worth noting some distinctions between patents and copyrights. According to Webster's New Collegiate Dictionary, a copyright is "the exclusive right to reproduce, publish, and sell the matter and form of a literary, musical, or artistic work." A patent is "a writing securing to an inventor for a term of years the exclusive right to make, use, or sell his invention." Before slapping the dictionary shut, an invention is "a device, contrivance, or process originated after study and experiment."

Michael Keplinger, chief counsel to the special government Commission on New Technological Uses, points out that a copyright is not a government grant. "It exists in something, if it is a work, from the moment it is created."
Generally, a work is considered to be copyrighted from the moment the pen leaves the page, without any formality. To be fully protected by copyright benefits, Keplinger suggests the copyright be registered with the Library of Congress. Two thousand copyrights were registered for software in 1978 and 1979.

Keplinger also talks about "the critical difference" between a patent and copyright. "A copyright is anti-rip-off protection. Copyrighted software can't be copied with only trivial changes-but you could take a close look at somebody else's software and take the main ideas to make your own program. Anyone else could create a program based on the same algorithm and copyright. But a patent is given for a process implemented in a program. After one is granted, writing another program with the same algorithm would be a patent infringement."

## Major Objections

This is exactly the objection the patent office has to programming patents. According to Thomas Lynch, "The basic rule of thumb is that anything can be patented if it is new and an improvement of what has been done before. But with programming (both firmware and software), you're talking about an old or existing machine programmed to do something different. A patent of a program is a patent for
an idea rather than for the development of a new structure."
However, businessmen such as Whitlow's president Aso Tavitian have "never considered copyright as worthwhile protection." Whitlow's Syncsort was jointly developed by several people in the small software company early in the '70s. A patent application was filed at that time. "The feeling was-and it was shared by all of us-that we had an invention.... My feeling is that to think about copyright as equivalent is 'way out'.... The purpose of a patent is to encourage innovation. It's like a reward: For 15 years we have a legal monopoly on this sort."
> ''The purpose of a patent is to encourage innovation. It's like a reward: For 15 years we have a legal monopoly on this sort.’'

Whitlow's attorney Morton C. Jacobs explains that the Syncsort patent is "not a program listing patent, as such, but a patent on a sorting system built with software." Jacobs has filed one of the several "friend of the court" briefs that the Supreme Court will consider in respect to the patent cases it is hearing this fall. His argument is particularly germane to microcomputers and other general purpose computers.
"Machines," Jacobs says, "are defined by their function-and it is the software that determines the function of a general purpose computer." He argues that "a new machine is created every time a new piece of software is entered."

In the brief submitted to the Supreme Court, Jacob states that "To remove the sorted program from the general-purpose computer is to remove its unique rule of action as a machine. This would be the same as untying the wires interconnecting the circuits of a hardware-

# Computer Merchandisers Hurt by Mail Fraud 

N0 arrests have yet been made in Chicago area towns following a rash of thefts which has left several computer supply houses around the country holding bad checks totalling nearly $\$ 140,000$. The scheme of theft by deception first came to light earlier this summer when complaints of bum checks began trickling into the Riverside Police Department from a number of out-of-state computer houses who had shipped merchandise C.O.D. to a Riverside address.
Outwardly, the customer appeared legitimate enough, bearing all the trappings of a bona fide business. According to Lt. Dokupil, chief of detectives with the Riverside PD, the goods were ordered by CMI, Inc., a phony company which maintained an office at 3340 S. Harlem Ave. An individual using the name of Thomas Janson (or "Jansen") used the premises as a base of operations from which he placed orders around the country for a variety of merchandise.

The same general procedure was used in all of the thefts. An order would be phoned in by CMI to a computer firm for a sizeable amount of software or hardware. At the time of delivery, the driver would accept the CMI check as payment for the goods, per standard procedure. Because the company had carefully created the illusion that it was in fact an established firm with a permanent business address nothing out of the ordinary was noticed-until checks started bouncing.

By the time the complaints reached the local police, the suspects had already fled and an investigation of the Harlem Ave. address revealed only a hurriedly vacated office. After Riverside, Janson and his accomplice apparrently set up shop in nearby towns, crow-hopping to a new location whenever things got hot.

One of the dealers who got stung was a Texas supplier who received a phone order from CMI for two hundred eight-inch and five-inch diskettes which the caller wanted shipped out as a
rush order. The order was sent out C.O.D. the next day, and when the UPS driver delivered, payment of $\mathbf{\$ 6 0 0}$ was effected by personal check. When the dealer received the check his suspicions were aroused by the absence of a company name and number on the face of the check; the scrawled signature of "Thomas Janson' ' was just barely discernible at the bottom of the check.
The dealer had little choice but to go ahead and deposit the check, and hope for the best. His suspicions were confirmed several days later when the check was in fact returned: The Illinois bank account upon which it had been written was no longer in existence. Neither CMI nor Janson were listed in the phone book. It was at that point that the dealer contacted the police in Riverside. At about the same time, similar reports began to reach the police from other dealers around the nation such as one in California who had been bilked out of $\$ 3000$ worth of hardware (color boards) in exactly the same manner.

The same scam was repeated numerous times from many different locations in the area surrounding Riverside. In each case CMI would abscond just before the police could close in for an arrest.

Most recently, the operation was headquartered in Morton Grove, IL. It is in this town that police feel they have compiled the most concrete evidence to date with felony warrants being issued for the arrest of Janson and his accomplice.

According to Det. Redman of the Morton Grove Police Department, a picture of the prime suspect has been distributed to law enforcement officials involved in the case in other locals.

Assistance has also been sought from the FBI due to the interstate nature of the crimes and federal charges will be leveled if and when any apprehensions are made. Among these is a "theft by wire" charge which is brought in in-
stances where a telephone is used as an instrument of larceny.

Lt. Dokupil advises all dealers who are defaulted to go directly to their local police with as much information as they can pull together. Dealers are urged to be doubly cautious when doing business with new clients, specifically, on C.O.D. orders. They are being admonished to accept only cash, money orders (cashiers' checks), or established charge cards.

One dealer, still smarting from his recent ripoff at the hands of CMI said, "We hate to do it, but now have to be much stricter with payment procedures; this (loss) is cash right out of our pockets."

## Future Home Computing

"The Home of the Future," the second annual Yankee Group symposium on home information utility, will be held Oct. 14-15 in Palo Alto, CA, and Oct. 21-22 in New York City. It will outline and discuss how access to computing power will be provided, who the suppliers will be, and how this trend will affect all users of electronic information processing.
According to the Yankee Group, the Home of the Future will be part of an information bus. Data bases such as The Source, CompuServe, and KnightRidder will be easily accessible.
But information of and by itself cannot exist in the marketplace. It must be carried by either telephone lines, coaxial cable, or the cost must be partially covered by other vendors. The Yankee Group believes that broadband communications must come to the Home of the Future.

The seminar will demonstrate how information access could be provided by either the telephone industry or the cable systems, and what the implications of either's actions will be.

Speakers at the symposium include: Ted Turner, Cable News Network; Gus Hauser, Chairman of Warner/Amex (owners of Qube, Columbus, Ohio); George Minot, Compuserve; Tom Harnish, OCLC (which is putting information data bases on line in 4,000 libraries); Irving Kahn, Broadband Communications; Jack Taub, The Source; and Howard Anderson, The Yankee Group.

For further information and registration, contact Marjorie Sugarman, The Yankee Group, P.O. Box 43, Harvard Square, Cambridge, MA 02138.

# A Slow Road to Bubble Memories 

The mere mention of bubble memory devices gets a rise out of most jaded floppy disk jockeys. Unfortunately, bubbles may not prove to be the memory panacea most expect them to be for some time.
The name of the game is mass storage and, for the microcomputerist, the options are few. Mass storage refers to the ability to save relatively large amounts of data in a nonvolatile medium. The three most popular mass storage methods currently in use are cassettes, disks (floppy and otherwise) and Winchester systems.
> 'It is no wonder that hobbyists are always looking for a better method of mass storage: one that is reliable, fast... and. . .cheap."

Each method has drawbacks. Cassettes are notoriously unreliable and are extremely slow. Also, individual cassette storage capacity is limited.
Disks are more reliable, have much faster access time, but are expensive. They also require an operating system which usually resides in RAM and uses up about 12 K of memory in a TRS-80.
Winchester systems are expensive, and often
a pain in the neck in terms of software support and compatibility.

It is no wonder that hobbyists are always looking for a better method of mass storage: one that is reliable, fast, easily maintained and, last but certainly not least, cheap. Enter rumours of the bubble.

Bubble memories are the latest development in the technology of mass storage. They are made of neither solid core material nor semiconductor material. Instead, they are composed of a microscopic film of magnetic material that is deposited on a nonmagnetic substrate or base. The magic of bubble memories is their ability to create zones of magnetization at discrete points throughout the magnetic film. These tiny magnetic points are opposite in polarity from the rest of the magnetic film, and each of these magnetic bubble zones represents one bit of information.

Bubbles are nonvolatile, that is they retain their magnetic polarity indefinitely without requiring external power, and are so small that millions can reside in the space of one IC. Space requirements are so minimal in fact, that a standard DIP (dual in-line package) bubble chip has 1 M bit of storage capacity ( 100 K bytes). That's roughly the equivalent of a single density, 40 track, $51 / 4$-inch floppy disk.

Bubble memory systems do have some disadvantages. The control and support circuitry necessary to access the bubbles is considerable, often requiring an individual control chip for each bubble chip. In addition, since bubble addressing is loop configured and semi-serial, data transfer rates are not particularly fast. A Texas Instruments' bubble system has an average transfer rate of 85 K bits per second compared with a TRSDOS formatted disk transfer rate of 100 K bits per second. Manufac-
turers are working on these problems now, and advances on both fronts should be forthcoming.

The three major bubble memory manufacturers today are Texas Instruments, Intel Corp., and Rockwell Int. Each offers bubble devices on both component and board levels, but none are seriously considering entering the personal computer market with their systems at this time.
George Riggs, a spokesman for Rockwell, explains that he does not see a small system market for bubble devices developing "for at least three or four years." He added that "when the cost is lowered to around 15 millicents per bit in bubble systems, the hobbyist will find them an alternative to other systems." This inevitable cost reduction will take time, however. Rockwell does have a bubble system available now. Their 256 K bit board can be bought for $\$ 1800$.
> 'For the present, bubble memories do not seem to be a practical alternative for the vast majority of small system computerists."

Intel of Santa Clara, CA, markets a boardlevel bubble system in kit form. Their 7110-1 Magnetic Memory board comes complete with all control and support circuitry, and sells for around $\$ 2000$. Judy Kochanowski of Technical Marketing at Intel feels that although no plans are afoot to crash the hobbyist marketplace in the near future, their $7110-1$ kit is "competitively priced" when compared with the current cost of a four-disk system for micros.
For the present, bubble memories do not seem to be a practical alternative for the vast majority of small system computerists. The problems related to support and control in both hardware and software are beyond the range of all but fanatical uses to solve. In addition, the cost per Mbyte of storage in bubble devices has not yet fallen low enough to justify their use.
Finally, none of the major manufacturers in the bubble industry take the small system user very seriously. When, and if, these manufacturers sense the existence of a market for their bubble devices in the microcomputer field, rapid developments in small system bubble devices can be expected. Until that time, micro users will continue to CLOAD, disk dump, watch and wait.

## I made the TRS-80 into a serious computer. Now I've made the Model II into a spectacular one.

I'm Irwin Taranto, and I've helped almost a thousand businesses get their first computers up and running.

I've done it primarily with the TRS-80, because it's a really elegant piece of hardware. Given the right programs, it can do substantially the same work as the traditional minicomputers that cost four times as much.

I proved it with four on-line, interactive programs adapted from the genuine Osborne \& Associates systems, originally designed for the $\$ 30,000$ Wang computer. Then I added two of my own and made them all work on a $\$ 4000$ TRS-80.

Now I've done the same thing for the new TRS-80 Model II. It's an $\$ 8000$ computer that works twice as fast and has four times the memory - up to two million characters.

My new systems are fully documented, and because I'm working with a much more powerful computer, they're a night-and-day advance over the Model I programs. They'll turn your Model II into a complete business computer, set up and ready to go.

## THE TRE-80 MODEL II PROGRAMS

General Ledger/Cash Journal: handles up to 7000 transactions on 500 different user-defined accounts. It keeps track of them by month, quarter and year, makes comparisons to the prior year, and does departmentalization.
Accounts Payable/Purchase Order: generates the purchase order and posts the item to payables when the goods are received Invoice-linked, it calculates and prints checks and aged ledger reports and links fully to the general ledger
Accounts Recelvable/lnvolcing: keeps track of billed and unbilled invoices, open and closed items, aging and service charge calculation. It prints statements, links to the general ledger, and can work within either an invoice-linked or balance-forward accounting system.
Payroll/Job Costing: computes regular, overtime and piecework pay, keeps employee files, figures taxes and deductions, prints checks. journal, 941-A and W-2 forms, and breaks out individual job costs.

When I say set up and ready to go, I mean just that. If you're not quite sure on that point, call the number below and we'll give you the names of some of the people who've already bought all over the world. Call them up and hear what they have to say.

These Model II programs are completely customtailored, which explains their $\$ 249.95$ price. Before we'll send you a disk, you have to fill out a detailed questionnaire that tells us your precise business requirements. Then we send you the disk, all the instructions you need, and my phone number. If you call, we answer all your questions. If your questions are tough enough, I'll talk to you personally

Because that way I'll make sure that Model II of yours turns into a spectacular computer, just like I promised.

## The Micrographics Index

The National Micrographics Assoc. (NMA) Resource Center has released the latest 1980 computer-output microfiche edition of the Micrographics Index and Special Interest Package \#15 entitled, Service Bureau vs. InHouse Systems, a collection of current articles that are part of the Resource Center's inventory.
Over 250 new entries have been added since the Index was last published in January 1980. The Micrographics Index is a catalog of the over 4,000 items contained in the NMA Resource Center. It provides direct, comprehensive access to the largest collection of micrographics in the world.
The Index includes information on micrographic applications, technical processes, case histories, standards, research reports, equipment evaluations, directories, "how to" guides, state-of-the-art reports, market studies and industry surveys. Journal, author, keyword and subject indices provide access to entries listed in the Index. Reprints of most items may be ordered from NMA in hardcopy or microfiche for a small fee.
Service Bureau vs. In-House Systems is a collection of articles that overviews the considerations in deciding to use a service bureau or to implement an in-house micrographic operation. Topics include evaluating and selecting a service bureau, justifying in-house COM and case histories of COM and source-document in house operations.
Service Bureau Versus In-House Systems is available in papercopy for $\$ 25$ and in microfiche for $\$ 15$. The Index can be purchased for \$35. Both are available from NMA Publication Sales, 8719 Colesville Rd., Silver Spring, MD 20910.

## Advanced Graphics Course

Datagraphics, P.O. Box 566, Dept. G, Union Station, Endicott, NY 13760, has a new program, Advanced Graphics Mini-instruction Course, Volume 1, Curves. The program is the first in a series of projects on graphics applications programming techniques.
Volume 1 uses a new algorithm for the old problem of plotting curves: None of the displays that are generated use advanced math, such as sines and cosines; a simple arithmetic progression-regression technique is used in-

Graphics Designed with Datagraphics Miniinstruction course.
stead. Graphics are executed on video within five to 20 seconds.

The program begins with a simple explanation of FOR-NEXT loops and line numbers, continues with amplitude equations, regressions and progressions. There is also a program included for designing computer art.

Supplied on tape for 16 K Level II or 4 K Level I, Advanced Graphics Mini-instruction course sells for $\$ 20.55$.

Reader Service - 160

## Macro Library Adds Nearly 80 New Mnemonics

Stoneware Microcomputer Products, 1930 Fourth St., San Rafael, CA 94901, is selling an extended instruction set macro library to work in conjunction with Microsoft's Macro-80, Digital Research's MAC and CDL/TDL Macro I and Macro II.
A macroassembler is defined in the Microcomputer Dictionary and Guide, Matrix Publishers, Inc., as something that "simplifies coding when similar sections of code are used repeatedly, but variations preclude the use of conventional subroutine techniques."

Stoneware's new library expands the Z-80/ 8080 instruction set with nearly 80 new mnemonics. They enhance the hardware instruction set by creating pseudo instructions which are reconstructions of the exsisting Z-80/ 8080 instruction set. The assembler mixes the new instructions with the existing set.

The library has been designed to be compatible with current software. It sells for $\$ 109.95$ for CP/M systems with eight-inch single density disks, and for $\$ 79.95$ for Model 1 TRSDOS on $51 / 4$ inch disk systems.

Reader Service $\boldsymbol{\sim} 169$

## Do-it-yourself Interfacing

A five-page booklet is available that provides instructions, schematics, a parts list and software driver listing for do-it-yourself interfacing between a TRS-80 and an RS-232 printer. According to the booklet, which costs $\$ 4.95$, the interface can be constructed for less than $\$ 2$ in parts.
The booklet, which was not named in the company announcement, is sold by Fobel Enterprises, 552 E. El Morado, Ontario, CA 91764.

## Business Data Base Plus Statistical Package

Charles Mann \& Assoc. has a new programmable Business Data Base System for the TRS-80 and a new Statistical Package. Business Data Base System allows the user to define and build data bases for such purposes as inventory control, general ledger accounting, accounts receivable and accounts payable. The fields may be manipulated with a math formula accumulator to format reports and present status displays.
The system is compatible with TRSDOS, NEWDOS and 3.0 DOS. The programs are auto linked and called automatically as needed. Business Data Base System needs at least 32 K RAM with 48 K recommended, and a single disk drive. Multiple disk systems are supported under user control.

The Business Data Base System is available for $\$ 89.95$ from Charles Mann \& Assoc., 7594 San Remo Trail, Yucca Valley, CA 92284.
The Statistical Package includes Scientific Data Management System and a number of

## ADVENTURERS! RISE TO NEW DEPTMSI <br> At Last, 3 Dimensions!

Deathmaze 5000 and Labyrinth are the first in a new breed of adventure. Instead of wandering through the English language, typing GO EAST or GO WEST, you move through a colossal maze represented on the screen three-dimensionally. Hallways recede into infinity or come to dead-ends. Doors open to right and left. Pits open in floor and ceiling. As you encounter objects, monsters, and mayhem, one or two word commands may be used. The command set is extensive and sophisticated. The proper commands allow the solution of problems and the manipulation of objects. The improper choice of words could spell the end. ...

## MACHINE LANGUAGE SOPHISTICATION

Deathmaze 5000 and Labyrinth are written in machine language. They are both incredibly fast. All the features expected of great adventures are built in, including SAVE GAME and a blinking cursor. All versions include relocation modules for use with disk systems.

Deathmaze $\mathbf{5 0 0 0}$ places you on the top floor of a five story building. Each floor is a maze of twisting passageways. Floors are connected by elevators and open pits. You have but one goal. ESCAPE ALIVE! Where is the only door out of this nightmare? Monsters, bats, mad dogs, hunger, and many more horrors plague your every step as you struggle to escape the most complex adventure ever written.
TRS-80 Level II 16 K cassette $\$ 12.95$
APPLE II or APPLE II PLUS 32 K cassette $\$ 12.95$
Labyrinth places you in a maze of gigantic proportions. But you are not alone! A minotaur searches for you, seeking a grisly meal. You must find weapons, spells, and treasures. You must deal with ghosts and cave gnomes. You must avoid the minotaur until the moment is right for the final battle.
TRS-80 Level II 16 K cassette $\$ 12.95$
APPLE II or APPLE II PLUS 32 K cassette $\$ 12.95$

P.O. Box 2574 Chapel Hill, NC 27514 (919) 933-1990

## REWARD!

This man escaped a fate worse than death. He was the first, but we hope not the last. From his condition, you would never realize that he designed Deathmaze 5000 . Those few others who survive may send their correct solutions to us. On December 31, a drawing will be held. Six intrepid adventurers will win their choice of three Med Systems programs and a shirt silk-screened with the above logo and the words " 1 survived Deathmaze 5000". Only the correct solutions are eligible. All judgements final. Please enclose a SASE for return of solutions or notification of correctness. All winners will be contacted directly.

## SATISFACTION GUARANTEED!

All Med Systems Software products come with a 14 day moneyback guarantee. If for any reason you are not satisfied, return your order within 14 days for a prompt and cheerful refund.

## ORDERING INFORMATION

Orders are processed within two working days. Mastercard and Visa card holders please remember to include the expiration date. We pay all postage and handling within the U.S., Canada, and U.S. territories. European orders please include $\$ 2.00$ for air post.

Ask about our other adventures. These include Samurai, Reality Ends, Bureaucracy, and The Human Adventure.

Please send the following 3-D adventures: $\square$ Deathmaze
(\$12.95) \$
-Labyrinth
(\$12.95) \$ $\qquad$

CONTROL PROGRAM FOR MICROCOMPUTERS ENABLING YOU TO RUN SOFTWARE PUBLISHED FOR CP/M 1.4 ON THE TRS-80
CP/M is considered the industry standard disk operating system because it gives you the hardware-independent interface you need to make your com puter work for you. CP/M 2.0 is the latest in the evolution of a proven reliable and efficient software system. FMG CORPORATION NOW OFFERS THE CPM 2.0 FOR THE TRS-80 It features an enhanced upward compatible file system and powerful new random access capabilities. The CP/M 2.0 from FMG provides the ability to run software published for the CP/M system, on the TRS-80 Model II. From
minidisks, floppy disks, all the way to minidisks, floppy disks, all the way to
high-capacity hard disks, the flexibility of CP/M 2.0 makes it a truly universal operating system. The package includes an $8^{*}$ system disk, editor, assembler and debugger for the TRS-80

## STANDARD

A deluxe operating system that provides big computer facilities at small computer prices. MP/M is a monitor program which operates with your microcomputer to provide multi-terminal access with multiprogramming at each terminal. Best of all, it's CP/M compatible which means you can run a wide variety or programming languages, applications packages, and development software.
You can run simultaneous editors, program translators, and background printer spoolers. Or you can use MP/M for data entry or data-base access from remote terminals. Or you can use MP/M realtime features to monitor an assembly line and automatically schedule programs for execution throughout the day. MP/M makes an excellent focal point for a cluster of connected microcomputers. The possibilities are limitless. (Format B)

## Single-key Entries for DOS

Mediamix has a program for TRS-80 disk users called Super Directory. While in the DOS command mode, the user enters $D$; the computer then asks for the drive number and an indexed directory of that drive's disk is displayed along with a menu of command modes. A single keystroke will put the user in RUN, KILL, FREE or PRINT.
Super Directory is a machine language program for TRSDOS or NEWDOS users. It is sold for $\$ 9.95$ by Mediamix, P.O. Box 8775 Universal City, CA 91608.

Reader Service - 172

## Faster Drives Are for Sale

Aerocomp, Inc., P.O. Box 24829, Dallas, TX 75224, has a new line of disk drives with the MPI drive acting as the center of the system. With an access time of five milliseconds, the company claims that MPI drives are the fastest in the field, and offer the most accurate disk positioning in the industry. Centering is accurate within 0.0008 inches.

Aerocomp's New Disk Drive

The Aerocomp drives' power consumption is low at six Watts standby, 12 Watts operating. All write-protect and index sensing is accomplished optically. They also allow users to flip disks to utilize both sides.

No pricing information was included with the company's product announcement.

Reader Service - 167

## Double-density Storage Boost

Percom Data Co., Inc., 211 N. Kirby, Garland, TX 75042, has begun production of a double-density disk-controller adapter for the TRS-80 Model I. The adapter is called Doubler. According to Percom's calculations, using Doubler an 80 can store and format up to 354 K on a five-inch disk, compared to the 256 K of a standard eight-inch floppy.

Doubler is sold with DBLDOS, which is a TRSDOS-compatible double-density operating system, and with a utility to convert singledensity files and programs to double-density format. The complete system sells for $\mathbf{\$ 2 1 9 . 9 5}$ from Percom.

Reader Service - 170

## T/Maker Report Generator

A software tool, combining a tabular report generator with word processing, is available from Lifeboat Assoc. The T/Maker system provides easy analysis and presentation of numerical data and text copy used in financial modeling and report preparation. Typical T/Maker applications include sales projections, profitability studies, balance sheets, estimates, price sheets, etc.
The system includes a full screen editor. A macro command allows any series of keystrokes to be saved and executed with one keystroke. Text insert, delete, global search and replace, and block move are all supported by the editor. Computation for rows and columns includes: standard arithmetic; percents; exponents; common transcendental functions; averages; maxima; minima; projections, etc.
The T/Maker requires a $48 \mathrm{~K} \mathrm{CP} / \mathrm{M}$ system and C-BASIC-2. It costs $\mathbf{\$ 2 7 5}$ from Lifeboat Assoc., 1651 Third Ave., New York, NY 10028.

Reader Service - 177

## Eight-inch Floppy Drives

Parasitic Engineering's Maxi-disk eight-inch floppy disk drives are now compatible with the TRS-80 Model II. Used with the Model II, Maxi-disk drives are functionally identical to Radio Shack expansion drives. No software or hardware changes are needed.
Each drive is contained in its own cabinet. Additional drives are simply plugged in, so that a drive can be removed for service without dis-

## Maxi-disk Drives

turbing any other drives on the system.
The drives cost $\$ 845$, plus $\$ 60$ for the threedrive cable which is needed for connection. They are sold by Parasitic Engineering, Inc., 1101 Ninth Ave., Oakland, CA 94606.
Reader Service - 163

## Video-oriented Text Editor

Southeastern's Textan is a machine-language text editor designed to operate on 16 K machines. It is a video-oriented editor designed for BASIC programmers. Textan reads program tapes written in Level II BASIC and returns to BASIC with the program fully loaded when editing is completed.

This text editor has 32 command functions and 26 reserved-word keys. The command functions provided include: previous screen, next screen; auto line numbering; block delete; display free memory, etc. The reserved word keys will automatically enter many standard BASIC commands.

The package costs $\$ 40$, plus $\$ 7.50$ for the manual, from Southeastern Software, 512 Conway Lane, Birmingham, AL 35210.

Reader Service $\boldsymbol{\sim} 179$

## Model II General Ledger

GL is a general ledger system for the TRS-80 Model II. It requires TRSDOS 1.2, a 132column printer, a dual disk system, and 64 K memory. It is part of a larger accounting system which includes A/R, A/P, and Payroll. Summary transactions from these packages are accepted automatically by GL.

The GL package produces departmental and summary income statements showing current and year-to-date amounts, percentages by category, and comparative data with the general ledger one year ago. The chart of accounts contains a five-digit account number; account description; and current, year-to-date, and budget balances. Users specify account
type, master/sub account code and balance sheet column code.

The major outputs are trial balance, balance sheet, income statement and department income statements. The major programs are Master File Maintenance/List, Transactions/ Enter/Register/List, Account Status/List, Generate Financial Reports, Accounting Transactions Transfer, End-of-period Processor and System Initialization. ISAM is used for fast random key and sequential access.

GL sells for $\$ 129$ from Micro Architect Inc., 96 Dothan St., Arlington, MA 02174.

Reader Service - 165

## Horse Handicapping Program

A horse race handicapping package for the TRS-80 and Apple home computers is being sold by the 3G Co. The company has gathered and stored data from a vast number of races, and analyzed which attributes contribute to a horse's performance in a race, either positively or negatively.

The package consists of a guide on how to use the "Daily Racing Form" to obtain the ten factors needed for each horse, a sample form to simplify the data gathering, a cassette that computes the odds for the current race, a program listing for use with other types of computers, and tips on how to use odds when wagering.

The package costs $\$ 19.95$ from 3G Co., Rt. 3, Box 28A, Gaston, OR 97119.

Reader Service - 164

## Low Cost Dot-matrix Printer

DIP, Inc., is selling a low cost Data Impact Printer, the model DIP-81. It is priced at $\$ 499$. The model DIP-81 is a dot-matrix impact printer, designed for continous duty cycle.

The model DIP-81 features 7-by-7 or expanded 14-by-7 matrix printing, an up-
per/lower case character set, 100 characters per second in a bi-directional print-out and ribbon cartridge loading. It uses ordinary bond paper in sheets, roll or fanfold form.
With full 96 character ASCII set, it is capable of both upper and lowercase printing at both 40 and 80 characters per line. Operator control includes power, select/deselect, line feed, top of form and self test. A Centronics compatible parallel interface is standard. Serial RS-232C or 20 mA current loop is optional.

Contact DIP, Inc., 121 Beach St., Boston, MA 02111 for more information.

Reader Service $\boldsymbol{\sim} 185$

## BASIC to FORTRAN

The Management, Box 111, Aledo, TX 76008, has a programmer utility called FORTRANslator. It is designed to aid in the translation of TRS-80 Disk BASIC Model I programs to TRS-80 FORTRAN.

FORTRANslator converts BASIC into the structured READ, WRITE, FORMAT constructs. It also translates BASIC key-words and procedures such as IF-THEN-ELSE into correct style. FORTRAN indentation and spacing, $C$ lines, DO loops and other conventions are produced. A program can be created and debugged in BASIC, then translated to compiled FORTRAN.

This machine-language program will run on a 32 K machine with at least one disk drive. A printer is recommended. FORTRANslator is priced at $\$ 29.95$ and is supplied on a Model 1 data disk.

Reader Service ~ 178

## Land Surveying Applications

Four land surveying programs for TRS-80 have been developed by Disco-tech. They are Field Note Data Reduction, Coordinate Geometry, Stadia Reduction and Horizontal

Curve Staking. They are included in Discotech's Survey 80 package.

The Survey 80 package has been developed and field-tested by a team of practicing land surveyors. The four programs allow users to choose various methods of solving technical problems. Fifteen-digit accuracy is built in where appropriate, and ouput can be displayed on the screen and/or printed out.

No computer knowledge is presupposed. Steps are presented logically and lucidly on the screen. Programs are supported by manuals which guide the user step-by-step through hardware installation, data entry, computation, and output. The manuals are reinforced by practical examples and appendices which treat common problems and care of magnetic media.

Survey 80 is available in a TRS-80 Model I version, and by November will be offered in a $\mathrm{CP} / \mathrm{M}$ version.

Field Note Data Reduction costs $\mathbf{\$ 2 5 0}$, Coordinate Geometry costs $\$ 350$, Stadia Reduction costs $\$ 175$ and Horizontal Curve Staking costs $\$ 95$. The programs are sold by Disco-tech, a division of Morton Technologies, Inc., P.O. Box 11129, Santa Rosa, CA 95406.

## Video Football with Strategy

Acorn Software Products, Inc. has another new game-Pigskin, a football strategy game for the Model I Level II.

Two players can compete against each other, or one player may challenge the program in one of five levels of difficulty. Any game in progress can be saved.

Pigskin's graphic display of the field shows ball movement and statistics as players employ their skills. Strategy involves the use of ten offensive plays and six defensive positions.

The game is priced at $\$ 9.95$ on cassette, or \$15.95 on disk from Acorn Software, Inc., 634 North Carolina Ave., S.E., Washington, D.C. 20003.

Reader Service $\boldsymbol{\sim} 168$

Pigskin's Graphic Display

## If you just bought another printer, boy are you gonna be sorry.

## Epson.

The Epson MX-80. It's not just another workedover rehash of last year's model. It's our top-of-the-line 80 -column printer. It's new. From the ground up. And it's the most revolutionary printer to hit the market since Epson invented small printers for the 1964 Olympics in Tokyo. Don't take our word for it, though. Compare. There simply isn't a better value in an 80 -column printer. Period.

But here's the fact that's going to stand the printer world on its ear. The MX-80 sports the world's first disposable print head. After it's printed about 50 million characters, you can throw it away. Because a new one costs less than $\$ 30$, and the only tool you need to change it is attached to the end of your arm.

Now that's revolutionary, but that's only the beginning. The MX-80 also prints bidirectionally at 80 CPS with a logical seeking function to minimize print head travel time

The world's first disposable print head. It has a life expectancy of over 50 million characters, yet it's so simple, you can change it with one hand. And it costs less than-repeat less than- $\$ 30$.

and maximize throughput. It prints 96 ASCII, 64 graphic and eight international characters in a tack-sharp 9x9 matrix. And it provides a userdefined choice of $40,80,66$ or 132 columns and multiple type fonts.

We spent three long years developing the MX-80 as the first of a revolutionary series of Epson MX Printers. We employed the most advanced automatic assembly and machining techniques in existence to produce a printer that is incredibly versatile, remarkably reliable and extraordinarily inexpensive. It's a printer that could only come from the world's largest manufacturer of print mechanisms: Epson.

If it sounds like we're proud of the MX-80, we are. Not only does it do things some of the world's most expensive printers can't do, it'll do them for you for less than $\$ 650$. That's right. Under $\$ 650$.

And if that isn't revolutionary, we don't know what is.

## Have

## The Courts

## Dennis Bathory Kitsz <br> Roxbury, VT 05669

Back in the days of huge, marvelous and mystical mainframes, computer programmers spent years creating massive utilities and procedures for their customers. You've seen the pictures. Tied-andjacketed men huddled over computer printouts with the kind of serious demeanor normally reserved for beleagured generals. But at the end of their work, they found security: the comfort of a job well done, the respect shown by appreciative and intimidated clientele, and, of course, substantial financial reward-all in good time, to be surebut inevitable.
The year is 1980, and a change in the public's awareness now threatens that security and professional calm. The microcomputer has fallen from mystique to appliance, merely another contender for customer dollars in a clamoring marketplace.

What has programmers, software companies and software distributors so worried is an epidemic of program copying and trading that is very difficult to discourage under the current law. Stated very simply, the copyright laws, the most general form of protection for authors and artists, may not apply to the final versions of programs as prepared and sold on magnetic mediadisks, tapes, wafers-or in read-only-memories (ROMs).

Dennis Bathory Kitsz is a composer, programmer and columnist for 80 Microcomputing. He is an active defender of contemporary arts. His music has been performed in the United States and Europe. As an artist and a programmer, Dennis has been directly involved with the technical, aesthetic and legal aspects of the copyright issue for over a decade.

## The Copyright Law

The copyright law has a strong and impressive history of protection for authors and their works dating back to the eighteenth century, and rooted in common law. The Copyright Act of 1909 was framed around laws intended to protect published works, which quite plainly meant the printed word. The need to protect visual plastic arts (painting, sculpture) or technical arts (film, photography, sound recording) had hardly arisen. Oddities such as player piano rolls began to force the law to consider material that was not readily translated by the naked eye, but until recently the law depended mostly on judicial precedent.

The original copyright law was enacted in 1790, close on the heels of the Constitution itself, in order to protect "any map, chart book or books now printed." Step by step its coverage was extended to include designs, engravings and etchings, printed music, drama, photographs and negatives, sculpture ('statuary and models'), writings of an author, and motion pictures.

The 1909 copyright law came under fire in the 1960s, when piracy of records and tapes in the music industry became a serious issue. The law protected published sheet music, but how many people were flocking to stores to buy sheet music? The recording, the million-selling gold record, was king.

Executives of the recording industry called for copyright protection. But since the music performed by their artists was created during the performance or in the recording session itself, it wasn't written music. For the copyright office to require it to be translated into sheet music seemed inconsistent with the changes in the art form itself. Besides the composers, performers, arrangers and distributors were getting ripped off. Was the creative sweat of the music industry's artists any less valid, they asked, than that of typewriterplunkers?
After more than sixty years, changes to the 1909 law were made to reflect changes in creative software. "Phonograms" became admissible for copyright, and all man-
ner of artistic, sculptural and film materials were legitimized.

The plano roll still didn't make it . . . nor did the computer program. The 1976 law did, however, introduce the term "works of authorship" as a term of general coverage.

At that time, the law provided that a commission on technological uses be set up to investigate two major problems with the act: The right of computer programs to copyright protection in their magnetic or ROM formats was unclear; and photocopying presented possible violations of copyright conventions.

The commission's final report called for copyright of computer programs. The report is nearly a year oid, and, as this article is being written, the House Judiciary Committee has completed brief hearings on H.R. 6934, designed to Implement some of those recommendations.

Within the industry an unspoken agreement for the most part has heid back a flood of illicit copying, and authors and vendors have placed copyright notices on their works in the hope that some sort of grandfather clause might retroactively protect their works.

Then came Data Cash v. JS\&A. .

The unspoken agreement fell to pieces in 1979, when Data Cash Systems, Inc. brought suit against JS\&A Group, Inc., in IIlinois Federal District Court. Data Cash claimed that JS\&A took its Compu-Chess program and marketed it, byte-for-byte, as their own JS\&A Chess Computer. The federal judge in the case held that the copyright law did not apply to the alleged ROM duplication, and denied Data Cash its motion for judgement against JS\&A.

The question of laws governing unfair competition was deemed to be another matter, and presiding Judge Joel M. Flaum issued no summary opinion on that aspect of the case.

The judge's ruling was straightforward: "The parties have assumed that the ROM is a 'copy' of the computer program within the meaning of both the common law and the 1909 Act. The court does not agree. ... A 'copy' must be in a form which others can see and read."

Bill Gates didn't like the ruling. He is one of the creators of Level II BASIC, and the president of Microsoft, generally acknowledged the industry's software leader.
"It has a lot of people very upset. But as far as I'm aware, there's nothing (in the law) that eliminates that (copyright protection).

Every manufacturer puts copyright notices on; Digital Equipment puts copyright notices on, we put copyright notices on. ..."

According to Gates, copyright laws are necessary to protect software from computer clubs or wherever people are likely to exchange it.

Said Gates, "If the law wasn't going to protect it, there wouldn't be any software written."

Just how extensive is the rip-off of programs in the home computer marketplace?

Large users' groups on both coasts maintain extensive libraries of programs for the purpose of sharing a cost burden; some such groups, but not all, discourage users from making their own copies from the library. New commercial libraries are beginning to advertise, with a "use fee" and an almost tongue-in-cheek "discouragement" of copying. Since a program is cheaper to copy than to buy, unlike a book, the program library becomes a tough problem for authors and vendors.

## The End User

But the user/trader presents a unique threat to program writers. Software is expensive to produce and its market is severely limited by the number of home computers in use. How many programs does an author sell? is it a "goldmine"? And how many sales are lost through gratuitous copying?

Bryan Mumford of Mumford Micro Systems doesn't care anymore. "I just decided it didn't matter."
"I sometimes wonder how much money I would make if I got paid for every copy of my programs that is being used. A lot more than I am now, you can be sure," says Mumford. "I do what I do, because I enjoy it, and If I start to get uptight about something like this, it stops being fun. Everyone isn't in this position, though. For most people, software sales are a strict and serious business. And bootleg copies are a big threat. Most computer people I know are upright moral peo-
> "The object phase of a computer program was not a copy within the meaning of the Copyright Act. . . since the object phase is not in a form which one can see and read with the naked eye, but a mechanical tool or machine part."

Judge Joel M. Flaum Illinois District Court

ple, but they can be bought pretty cheaply."
Mumford says that he sells just about one copy of a program per town, and, shortly thereafter, that town has a plethora of programs from Mumford Micro Systems.

Mumford's organization is small and personal, much like the bulk of the cottage industry that has supplied the home computer fleld. But Intersystems is a large, growing company with lots of capital investment. Its president, James H. (Hank) Watson, believes clubs are responsible for much of his dollar losses.
"Let's face it," he says, "You sell (a program) to a quasi-computer club which has 250 members. To John Jones. And Bill Smith happens to buy Microsoft BASIC. And somebody else buys FORTRAN. I bet you dollars to donuts that everybody in the club has them within a week. What are you going to do?"

Hank continues, "It's going to be much more of an opportunity lost than a direct loss on my books; I could easily justify a million dollars. I'm sure we've only sold 50 percent of the copies that are in the field. That's a direct opportunity loss to me of $\mathbf{\$ 1 0 0 , 0 0 0}$ in the first six months. It's in that range, and it's a lot of goddamn money. And when you figure what your software time costs by the time you come up with the final product, that's five man-years. It comes to a cost of middle five figures! It takes a while to recover."

But for the average user, those figures seem vague. Neither Watson nor Mumford
can pinpoint specific losses, cash represented by actual copies they have seen in the hands of others. Are their fears perhaps imagined?

An ad appearing in the now-defunct $O N$ LINE reads, "TRS-80: Swap quality disk software w/ doc? Send have/want lists to. . .." Or how about this one: "TRS-80 program lending library. SASE. Exchange; Dept LL. . .." Another claims, "TRS-80 'goodies.' Unique mix."

There seems to be an innocence about it, but what do these lists look like? One shocker comes in the form of (what else?) a computer printout, and contains more than 160 entries including RSM2D, REMODEL PROLOAD, NEWDOS + , G2 LEVEL III BASIC, PIMS, FORTRAN, Misosys Disassembler, DESPOOL, TRCopy, Electric Pencil, Electric Secretary, General Ledger, Mailroom Plus-58 programs in this expensive commercial category alone-plus 109 games! This collection represents the majority of the finest software available to the personal computerist, developed over the course of years and totalling several thousand dollars in retail sales. All of it is exchangeable for items on the same trader's "want list." The wanted items also include some of the best: SARGON, COBOL, SCRIPSIT ("priority request!!!!" the trader notes), Infinite BASIC, System Doctor, Taranto's inventory programs, Electric Paintbrush, and 26 more.

## The Quality Software Trader

With whom does this trader correspond? Where was he able to obtain dozens of programs? Who will fill his requests? The above-mentioned "quality disk software" trader, headquartered in the Northeast, contends that he and other traders are not only a positive force, but vital to the growth of the industry. He challenges the very premise of copyright protection.
"I reject, totally, the moral high horse that so many software vendors climb on. . . people are being ripped off in extraordinary
amounts. No one cares about this or writes about it because the effect is so distributed and the media is controlled by the vendors, or at least by people who have a vested interest in software sales."
"It is oh-so-easy to preach about how bad it is to trade software," he continues. "The traders are an easy target, for sure. It's easy for an author to point to them as the 'reason he left the market.' And people will believe that. They (authors) don't suggest that their poor sales might be due to poor or overpriced software. No, the tacit assumption is that all software is worth its assigned price. Once that's accepted you can 'prove' almost anything."

The gentleman does concede that there are times when software trading is destructive: "When the person receiving the copy would certainly have bought it anyway, and would have gotten his money's worth, and
> "If software trading was for some reason technically impossible. . .there would not be one-fifth as many authors."

## A program trader

doesn't take the money he saved and put it in anuther package. In all other cases (the vast majority), software trading. . . makes the participants better equipped and more likely to enjoy their machine and be productive authors themselves; draws someone into the hobby because of the software he can get; creates a sale that would not have occurred had the participants not been able to share the cost."

He continues, "Why do you think that 300,000 or so of these machines have been sold? Who do you really think buys all the software that is sold? If software trading was for some reason technically impossible, this system would not be one-fifth as popular as it is. There would not be one-fifth as many authors.... The fact is that software trading serves a real purpose in a hobby that is distribution-cost bound."

How will authors and vendors deal with this, indeed. Beyond the disagreement over the validity of program pirating, there are legal and philosophical entanglements as well. Over the years, industries as a whole have attempted to protect their developments in a number of ways:

- Patents. The embodiment of an original application or process is protected by this legislation, although obtaining a patent is time-consuming and costly. Computer programs have been generally excluded from this area of protection.
- Trade Secrets. A process or device whose workings are not released to the public is considered a trade secret. Any party obtaining the information is bound by the provisions of these laws. A non-disclosure agreement secures this secrecy for computer program vendors.
- Unfair Competition. Making a profit from the work of others is viewed as unfair competition. State laws vary widely on this issue; program authors with the economic wherewithal can pursue this route.
- Copyright. The expression of ideas in a human language is protected by this law. Registration with the copyright office secures universal copyright as well, which provides international protection in most non-Soviet countries.

It has become all too obvious to members of the "cottage" software industry that two of those protections, trade secrecy and unfair competition, provide little help. They are simply too costly for the small corporation, partnership, or individual author to employ to safeguard computerized works.

A large company like Microsoft, on the other hand, depends heavily on the idea of unfair competition. Bill Gates says, "We spend millions of dollars a year creating software programs, and we are protecting those in several ways. There's the trade secret laws where we get non-disclosure-

that's how we handle our source codes and our so-called commercial packages that are high-priced. But for our low-cost software, we simply can't do that. . . . But, if a trade secret is released, and people are taking advantage of (it), they are subject to a penalty."
"Our code is the trade secret," says Gates. "We're not giving it away, we're selling it, just like Coca-Cola; they license it. Or Dow Chemical...making ethylene. It's a trade secret, so those that have the process pay. They sign the non-disclosure, just like the people who receive our software sign our non-disclosure."
Gates differentiates between questions of fact and law. Legal remedies are only useful after it has been proven that the program has been stolen.
"You're talking about a thing that is sixteen thousand instructions with 256 possibilities for each one. I can certainly prove, if it's derived from my work, that it's derived from my work!. . . In the case of software, they (the court) would rely on expert testimony. If somebody's camouflaged the thing pretty well, that's a question of fact, not of law. The question is, did they borrow from my work. Okay, assume that I can prove that and convince the court that they borrowed from my work, then you have the question of law, what am I going to do about that?"

Intersystems' Hank Watson is looking for a solution. "If you even do find somebody, you publicly crucify them and hope that that is some deterrent. That's the only tack you can take, but no one has been successful in general. What we'd like to do is protect the concept."

But is the copyright taw applicable to computer programs? is it enforceable? Moreover, is it a desirable means of protecting program authors? Judge Flaum's decision against Data Cash Systems opens a wide gap between the law's explicit coverage and the recommendations of the Na tional Commission on New Technological Uses of Copyrighted Works (CONTU), set up in 1975 and whose work was completed in July, 1978.

In question is Section 117 of the 1976 law, which states in part, ". . . this Titie does not afford to the owner of copyright in a work any greater or lesser rights with respect to the use of the work in conjunction with automatic systems capable of storing, processing, retrieving, or transferring informa-
tion, . . . than those afforded to works under the law...."
"The purpose of Section 117," in the words of Judge Flaum, "is to preserve the status quo. It is not intended to cut off any rights that existed on December 31, 1977, or to create new rights that might be denied under the predecessor to the 1976 Act, the Copyright Act of 1909. . . or under common law principles."

One part of Judge Flaum's opinion in Data Cash vs. JS\&A echoed the dissent of CONTU Commissioner John Hersey, novelist and chairman of the Author's League of America. Sald Hersey, "Every program comes to fruition in its mechanical phase."

Judge Flaum in his decision nearly a year later, concurred, "Normally, a computer program consists of several phases," writes Judge Flaum, in an opinion which derives from Hersey's dissenting one. "The first phase is the development of a flow chart which is a schematic representation of the program's logic. The second phase is the development of a 'source program,' which is the translation of the flow chart into computer programming language... The third phase is...an 'assembly program' which is a translation of the programming language into machine language, l.e., mechanically readable language."

The crux of the judge's decision is summarized in his next few sentences: ". . . Assembly programs are virtually unintelligible except by the computer itself. Finally, the fourth phase is the...'object program' which is a conversion of the machine language into a device commanding a series of electrical impulses. Object programs... cannot be read without the aid of special equipment and cannot be understood by even the most highly trained program. mers."

With that in mind, Judge Flaum concludes, "Thus, at some point in its development, a computer program is embodied in material form and becomes a mechanical device which is engaged in the computer to be an essential part of the mechanical process."

CONTU, on the other hand, collectively felt that computer programs should be afforded the protection of the law, but conversely should not overly burden end-users. Thus, the Commission stated that copyright should forbid unauthorized copying of computer programs, should not inhibit their rightful use, should not prevent development or distribution, but should, in its words, "not grant anyone more economic

[^5]MicroMint presents COMM-SO : The TRS-80 I/0 solution.

The COMM-80 is the only interface you need to turn your TRS-80 Level I or II into a timesharing terminal with provisions for a printer. The COMM-80 combines the most used features of the RS expansion interface in a low cost unit containing a built-in RS-232-C interface ( $50-19,200$ baud software selectable), a full 8 bit parallel port ( 34 pin edge card Centronics compatible) and a TRS-BUS connector for future expansion. Up to 16 units can be chained together and addressed separately. Interface your TRS-80 to all standard RS-232-C devices including modems, CRT Terminals, printers and other computers. Smart terminal software (will run in 4 K ) is included at no extra cost.

Assembled and tested . . . \$179.95 Includes case, power supply, ribbon cable, parallel printer port, serial port and TRS-BUS connector plus smart terminal software (please specify Level I or II).
NY residents add $7 \%$ sales tax.

## As featured in: "I/O Expansion for the TRS-80" BYTE, June 1980

THE INTERFACE CONNECTION
power than is necessary to achieve the incentive to create." It proposes to eliminate the present ambiguous Section 117, and replace it with a new section specifically detailing those protections and limitations.
H.R. 6934, the bill now pending in the House of Representatives, will in part do that, defining a computer program as "a set of statements or instructions to be used directly or indirectly in a computer in order to bring about a certain result." The bill drops the oid Section 117, and includes new wording authorizing the user to produce copies only if "such new copy or adaptation is for archival purposes only and that all archival copies are destroyed in the event that continued possession of the computer program should cease to be rightful."

Nevertheless, H.R. 6934 does not define what constitutes a "copy." CONTU recommended protections that should clearly include magnetic tape, disks, and other related forms, as well as ROM chips themselves. The proposed law still leaves that decision to the courts.

## Fallure of Secrecy

One of the incentives that even CONTU found it had to address was the question of the small-scale programmer. It pointed out failings in the trade secrecy laws: "Because secrecy is paramount, it is inappropriate for protecting works that contain the secret and are designed to be widely distributed. ... It substantially precludes the use of trade secrecy with respect to programs soid in multiple copies over the counter. .

Finally, CONTU reported that unfair competition laws were neither nationally uniform nor applicable to situations in which unauthorized copying was being done without a profit motive-certainly the case in the "share it with a friend" cycle.

The Commission, however, was not unanimous. Its most comprehensive critic was John Hersey, one of CONTU's three dissenters on the matter of computer copyright. Hersey argues that a computer program in its final form is much more like the cam in a machine than the work of an author. His argument is straight to the point: "Printed instructions explain how to do something; programs are able to do it."

Hersey dismisses any analogy between computer programs and recorded music as well, claiming that true works of authorship may be "fixed" in many forms, yet their main purpose is communication among hu-
man beings. "But a program," he emphasizes, "does not communicate information of its own, intelligible to a human being. It utters work. Work is its only utterance and its only purpose. . . The mature program is purely and simply a mechanical substitute for human labor." Not a very pleasant thought for the many programmers who consider their works to be gems of creativity, efficiency and Inspiration.

Commissioner Hersey's dissent urges separate legislative protection for computer programs, but insists that they are "the embodiment of a system or process," and not a description of it, and from that point of view are legally ineligible in light of the underlying principles of copyright law.

The majority of programs are written in so-called "high-level" languages which are not compiled, where the object code so crucial to the arguments of John Hersey and Joel Flaum never appears.

A program on the TRS-80 home computer is created in that ugly but serviceably "human" language, BASIC. Admittedly, there is some translation and condensation that goes on while the program resides in the microcomputer, but when viewed intact on the video screen, the program looks like, reads like, and is constructed like the program created by the program, not a "mechanical part."

Things have been further clouded by the introduction and development of digital recordings and computer music. What part of the music or recording is "data base" (copyrightable) and what part is "program" (not eligible for copyright)? The distinction between data bases and programs is nebulous as well; every computer operates from a data base, as most computer Instructions have operands and no useful program can function without them. Whether these operands are already embedded in the program or are accessed externally, they remain integral parts of any computer action.

The processor, the microcomputer's controlling chip, does not know the difference, and cannot know the difference. Only a human can define the distinction between data base and program by reading the code or examining some manifestation of the bits and bytes. Every machine language programmer knows the feeling of having a program crash because it misguided the computer.

Perhaps it is the human distinction alone that is the crucial one, not the machine distinction.

# MULTI-USER OASIS HASTHE FEATURES PROS DEMAND. READ WHY. 

Computer experts (the pros) usually have big computer experience. That's why when they shop system software for Z80 micros, they look for the big system features they're used to. And that's why they like Multi-User OASIS. You will too.

## DATA INTEGRITY: FILE \& AUTOMATIC RECORD LOCKING

The biggest challenge for any multi-user system is co-ordinating requests from several users to change the same record at the same time.
Without proper
co-ordination, the
contusion and problems of inaccurate or even destroyed data can be staggering

Our Flle and Automatic Record Locking features solve these problems.

For example: normally allusers can view a particular record at the same time. But, if that record is being updated by one user, automatic record locking will deny all other users access to the record until the up-date is completed. So records are always accurate, up-to-date and integrity is assured.

Pros demand file \& automatic record locking. OASIS has it.

## SYSTEM SECURITY: <br> LOGON, PASSWORD \& USER ACCOUNTING

Controlling who gets on your system and what they do once they're on it is the essence of system security.

## (THEN COMPARE.)

Without this control, unauthorized users could access your programs and data and do what they like. A frightening prospect isn't it?

And multi-users can multiply the problem.

But with the Logon, Password and Privilege Level features of Multi-User OASIS, a system manager can specity for each tiser may be accessed and for what purpose.

Security is further ephanced by User Accounting a feature that lets you keep a history of whiohuser has been logged on, when and for how long.

Pros insist on these security features. OASIS has them.

## EFFICIENCY: RE-ENTRANT BASIC

A multi-user system is often not even practical on computers limited to 64 K memory.

OASIS Re-entrant BASIC makes it practical.

How?
Because all users use a single run-time BASIC module, to execute their compiled programs, less
memory is needed. Even if you have more than 64 K , your pay-off is cost saving and more efficient use of all the memory you have available-because it services more users.
Sound like a pro feature? It is. And OASIS has it.

## AND LOTS MORE...

Multi-User OASIS supports as many as 16 terminals and can run in as little as 56 K memory. Or, with bank switching, as much as 784 K .

## OASIS IS AVAILABLE FOR

SYSTEMS: Altos: Compucorp; Cromemco; Delta Products: Digital Group: Digital Microsystems. Dynabyte; Godbout: IBC Index: Intersystems: North Star: Onyx: SD Systems: TRS 80 Mod II; Vector Graphic: Vorimex
CONTROLLERS: Bell Controls: Cameo: Corvus: Konan: Micromation: Micropolis Tarbell: Teletek; Thinkertoys: X Comp.

Multi-Tasking lets each user run more than one job at the same time.

And there's our BASICa compiler, interpreter and debugger all in one. An OASIS exclusive.

Still more: Editor; Hard \& Floppy Disk Support; Keyed (ISAM), Direct \& Sequential Files; Mail-Box Scheduler; Spooler; all from OASIS.

Our documentation is recognized as some of the
best, most extensive, in the industry. And, of course there's plenty of application software.

Put it all together and it's easy to see why the real pros like OASIS. Join them. Send your order today.

What, then are the options? The law, of course, could be more defined to include software, more specifically than H.R. 6934, but the legal problems would linger for years as courts find and set precedents.

Another proposition is to provide convenient licensing companies that would handie royalties for program authors. It is a method which has worked with great success in the music industry, where such giants as the American Society of Composers, Authors and Publishers (ASCAP) and Broadcast Music, Inc. (BMI), follow the trail of recorded music through radio transmissions, in jukeboxes, and on retailers' shelves. How do program vendors view this possibility?

Hank Watson of Intersystems says, "That's a little bit different. They're talking about millions of coples of stuff. . . I think it's going to take a while to evolve. Going back to the fifties, there were lots and lots of pirates and there were fewer in the seventies. It's a process we'll all have to go through."

Watson's distinct lack of enthusiasm was echoed by others in the industry, who believed that copying would likely continue on the amateur level, and the volume of program sales would never be high enough to merit a network of licensing organizations.

Certainly, major publications in the field have been lax about discouraging software piracy. Almost alone in this crusade is Wayne Green, publisher of 80 Microcomputing, Kilobaud Microcomputing, 73 Magazine and owner of Instant Software. Green's weapon is cash-ten thousand dollars of it, up front-to reward the first person to turn in a major ISI software pirate for successful prosecution.

Has anyone tried to take him up on it? Green replies, "No, but to some degree the intent is working-it is having an impact with dealers, but I don't know how much it's impacting clubs."

Other publications have for the most part held their editorial tongues, offering an occasional fingerwagging, but sticking to safer, professional subjects such as the impact of computer technology on cartography, or why Pascal is the next standard computer language.

Whether a forced Infusion of morality to counter illicit duplication would have any effect is not discernible; those out to turn a profit by exploiting the work of others will hardly heed cries from editors, if the copyright law remains ineffective.
> "Yes, surely, some computer programming is wonderfully creative. But copyright was not designed to protect the products of creativity as such; it was designed to protect literary works. . ."

John Hersey Author and CONTU Commissioner

In recent correspondence, John Hersey expanded his dissent. "Yes, surely, some computer programming is wonderfully creative. But copyright was not designed to protect the products of creativity as such; it was designed to protect 'literary works.' The designer of the cam was immensely creative, too; the inventor of the wheel was a genius-would that we knew his name to thank him! But we don't copyright those things.'
The question of musical performances, especially with the advent of electronic music, was again posed to him in light of a program being analogous to a cam.
The musical "instruction set" consists of representations of specific actions to be taken, very much like those of a cam, and the untrained individual cannot "read" these instructions into the mind's ear. A very, very few highly trained specialists can.
The fingers must push "up-down" and the tongue and lungs go "in-out," or there is silence from the winds; the arms must go "back-forth" while the fingers go "updown" or the strings are quiet; and so forth.

After much harangue about objectivity and a sizable long distance bill, the editors have succumbed to Kitsz' right to a philosophical digression.

Very little music is strictly theoretical; it is a set of printed instructions to produce the final sound, no matter whether that reading is done by a violinist or by an optoelectronic score reading device. The score itself is not the music, but a very digital-looking analog of the music, directly accessible only a few highly skilled "readers.

Hersey disagrees, believing "a musical score is not analogous to a program. The score tells the human performer what fingers to push 'up-down' on wind instruments, and when the lungs should go 'inout,' and what the fingers should do on the strings. In the case of the computer program, the instructions become part of the machinery and make the 'up-down' and 'inout' take place."

As for the composer of computer music, Hersey again takes the opportunity to distinguish between the human and the machine. "I would certainly think that the electronic composer's music, or score if that is the product-whatever issues from the computer and can be perceived by the human ear can-should be copyrightable. It manifestly is. It is the product of the composer's creativity. He may also have been creative in manipulating the machine to produce the music, or the printout, but it is my view that that sort of creativity can be and should be protected under other laws than copyright.

Melville B. Nimmer teaches copyright and constitutional law at UCLA, and was Vice-Chairman of CONTU. While sharing some of Hersey's reservations, he is prepared to distinguish between two general types of computer programs. The first would be eligible for copyright, and would include "works which themselves qualify for copyright protection.... On the other hand, programs which control the heating and air-conditioning in a building, or which determine the flow of fuel in an engine, or. which control traffic signals, would not be eligible for copyright because their operations do not result in copyrightable works.
He then departs considerably from Hersey's point, claiming that the distinction is "consistent with the recognized copyrightability of sound recordings. It sometimes has been argued that while printed instructions tell how to do work, computer programs actually do the work. But this is also true of sound recordings, which in a
sense constitute a machine (the phonorecord) communicating with another machine (the record player)."

As a whole, CONTU defended the concept of programs as works of authorship. In fact, the defense included some remarkably colorful, if dubious, considerations about those items presently eligible for protection.
"Traditional works have led to processes both more rigid and more flexible than those to which computer programs lead. When a phonorecord or motion picture is used in conjunction with a properly working machine, the same result will occur on the first, the second, or the thousandth running. The chorus will remain silent until the fourth movement of Beethoven's Ninth Symphony, and Bogart will stay in Casablanca forever. ... The process is virtually immutable. That is less true when a program is used, since it contains alternative branches selected only after use has begun..."

Artists and philosophers would have a hard time with those claims, however attractive they may be in the defense of a program author's right to legal protection. Subtle or gross differences of acoustics, speed and fidelity dramatically alter that "immutable" recording of Beethoven-the recordings can be played in monaural, stereo, or synthetic quadraphonic, or on small players with styli suitable only for sewing. Bogart's trysts may be obscured by faded film, a geriatric projection bulb, variations in shutter speed and screen size.

By contrast, a computer program is only reliable, only viable, in a trustworthy medium with an accurate CPU and stable memory. Its speed may be transformed, perhaps by the system's clock, but the forgiving flexibility of even the "fixed" art forms is unwelcome in the precise world of computer activity.

Philip K. Hooper is a programmer, author and authority on 6502-based systems. Hooper notes that at some point the interaction is initiated on the human level. "If one is referring to the program and its preset data in the computer, then there is no case (for copyright), just as one assumes that the bands on a record are in a certain order. Only the breakpoints introduced by user interaction really put the computer into a different realm. Human interaction pro-
duces a greater variety of consequence streams."

The philosophical questions are not peripheral to the copyright issue; they are in fact at the heart of it. All parties seem to be agreed when the query is posed, "should computer programs be afforded protection under the law?" The legal and humanistic storms are born by asking, "which laws shall protect them?"

Can the copyright law protect the computer program? Bill Gates believes he can recognize his program, "camouflaged" or not. But can copyright law distinguish the difference?

There are many methods of camouflage; some can well be defined as translation into a foreign language, while others involve encoding in the manner of a secret message. Translation into a foreign language is not a difficult problem, and traditional works have long been protected in that realm. But take for example, the following 16 bytes of Level II BASIC machine code. These are the opening instructions copyrighted by Microsoft:

F3 AF C3 7406 C3 0040 C3 0040 E1 E9 C3 9F 06

In the form presented here, and by means of any Z-80 disassembler available, these instructions can be transformed into the mnemonics of:

$$
\begin{array}{ll}
\text { DI } & \\
\text { XOR } & \text { A } \\
\text { JP } & \text { O674 } \\
\text { JP } & 4000 \\
\text { JP } & 4000 \\
\text { POP } & H L \\
\text { JP } & \text { (HL) } \\
\text { JP } & \text { OLGF }
\end{array}
$$

We have here visible, human-readable code. It is unremarkable and undistinguished as a small excerpt, but a large block would be clearly identifiable as Level II BASIC. Below are another 16 bytes of hex code:

79 D7 E1 BA 0360802061802070 E4 E1 CF 83

This code translates into the following interesting mnemonic instructions:

| LD | A,C |
| :--- | :--- |
| RST | 10 |
| POP | $H L$ |
| CP | $D$ |
| INC | $B C$ |
| LD | $H, B$ |
| ADD | $A, B$ |
| JR | $N Z, \$+63$ |
| A,B | JR NZ, +72 |
| CALL | PO,CFE1 |
| ADD | $A, E$ |

This is useful code as well, and a careful first examination of this code might reveal no relationship whatever between the Level II excerpt and the second block of bytes. However, one need only present the first four bytes of each and convert them to binary to discover the ploy:

11110011101011111100001101110100 01111001110101111110000110111010

Each bit has been rotated to the right one position! It would take not more than a dozen bytes at the entry point of the "camouflaged" program to rotate an entire 12 K copy of Microsoft's BASIC one bit back to the left, and there it would be, ready to use. The magnetic copy, moreover, would not match the original "stolen" program in format, parity, checksum, nor byte pattern.

It does not become a copy until it is under the user's control! Who, then, is the offending party? No translation was effected; rather, in its magnetic, object and disassembled versions, it is a completely new program.

Oure yesw ouldn oth avet oom ucht roubled iscerningt hatt herei ss omes orto te ncodingb eingi mplementedi nt hiss entence. In fact, concerning literary works, this manner of poetic license is normally allowed under the concept of artistic freedom of manipulation. The structure of the sentence has been so changed that a normal reading is rendered virtually impossible. An identical process was employed in rotating those 16 bytes, and direct, unmodified execution of the code would in no way lead in the same direction as does Level II BASIC

Microsoft's Bill Gates feels that the wording of the law should merely "make it clear that the copyright law covered [magnetic media]. It is not an extension. Look at the thing that commissioned CONTU to start with," says Gates. "It doesn't say that the law doesn't cover these things; it says that they've been asked to come up with a clear position clarifying the exact procedure."

House Judiciary Committee counsel Bruce Lehman reports that H.R. 6934 is likely to become law during this session of Congress. The bite of this law, if any, may not be felt for some time, based upon the bill's generalized wording. The entire document, the "Computer Software Copyright Act of 1980," is a single slip of paper, and the legal entanglements are hardly unsnarled by its ambiguities.

## The Lock and Key Method

So the problem waits for a legal solution while programmers and vendors continue to seek refuge in the lock-and-key method. Major programs are provided with special loaders which must gain control of the microcomputer before the remainder of the program may be fed into the machine. The first and best known of these loaders is provided with Microchess, introduced for the TRS-80 two years ago. The loader is almost, but not quite, identical to the normal TRS-80

SYSTEM command; it was therefore the easiest lock to open even for amateur machine language enthusiasts.

More sophisticated loaders began to appear, including those from such vendors as The Bottom Shelf and ABS Suppliers. These loaders actually alter the baud rate at which data is input to the computer. Disk programs, already protected to some extent by the difficulty of working directly with the disk's data transfer system, lend themselves even more so to security-the loader effectively disappears once the program is in place. At disk speed, this process is virtually instantaneous and quite opaque.

Others, like Electric Pencil, block-move themselves all around memory in a game of electronic hopscotch. But, as one reader comments, "Aside from legal or ethical questions, how are you going to stop pirating of software? . . . If by some means a program is made 'uncopyable,' someone will figure out a way to copy it sooner or later."

Even Wayne Green agrees: "We prefer to make everything as simple as possiblebut on the other hand, there are other programs that can decipher anything you can do."

Bill Gates speaks defensively and excitedly of his own company's reactions: "Looking at the amount of software we offer, we are the most ripped-off company around, because we offer a broad range, and we try to offer it for these low-cost computers. And we view the thing totally as an experiment. If there aren't enough honest people out there to buy the stuff, we'll end it. Most of our packages we won't put down at the low end."

In its advertising, Microsoft bills itself as setting the industry standard. Gates claims that his "experiment" can be ended at any time. But CONTU addresses the issue of corporate size, concluding that the social effects of the current copyright law's ambiguities are more acceptable to the individual rather than the corporate author/programmer.

CONTU even questions whether the independent will really benefit from an extension of copyright protection, asking rhetorically, "why do the large industrial corporations press for copyright?" The Commission answers itself with caution, suggesting that copyright protection might tend to reinforce the dominance of the large corporations over the small, independent houses. This was borne out by the influences of lawyers and patent specialists representing
> "Let's face it. You sell one (a program) to a quasi-computer club which has 250 members. To John Jones . . . I bet you dollars to donuts that everybody has it within a week."

Hank Watson<br>Intersystems

large computing firms during the CONTU hearings.

Here, the subtle debates over "works of authorship" fall victim to the harsher activities of supply and demand. There comes the realization, finally, that Data Cash sued JS\&A not to pursue a philosophical or moral crusade, but to prevent JS\&A from earning a profit on Data Cash's work.

The house of cards has begun to fall as a result of the JS\&A decision. One other case that may be affected involves Nestar Systems. Nestar Systems, based in Palo Alto, has asked for a restraining order against a European company which plans to market for the PET a package called The BASIC Programmer's Toolkit. Nestar alleges that the unnamed Netherlands-based organization plans the marketing of cassette or disk versions of its ROM product, and the JS\&A decision has Nestar concerned about its rights.

Harry Saal, president of Nestar, is unclear about Judge Flaum's decision in the JS\&A verdict, for Saal claims that "a human was very capable of understanding the 1's and 0's." The differentiation Flaum had made, of course, was that the eligibility of machine-readable code was in question, not its translation into ones and zeros.
"it's simply our feeling, and I believe it will be shared by everyone else who reads 80 Microcomputing," says Saal, "that the act of creating software is a development process that needs to be protected somehow. There must be a means by which people, having performed their work, can be free to market their efforts without some-

## KEEPIT - Version 2.0 <br> Enhances Level II Basic!

KEEPIT adds these function:

- Save a running BASIC program with variables
- Restore a program accidentally deleted by "NEW"
- Observe and change memory locations directly
- Save a block of memory as a system tape

## KEEPIT also features:

Keyboard debounce, audible beep and autorepeat! KEEPIT is written in machine language and resides in less than 1,000 bytes of high memory. EDTASM source code is also supplied so the user can relocate the program at any convenient location.

## How to order KEEPIT:

Level II users will find KEEPIT to be an extremely valuable utility as well as a frustration saver. To receive your copy, send you name and address, along with $\$ 9.95$, to:

1806 Ada Street Lansing. MI 48910
Phone: 517/485-0344
Visa, Master Card, and C.O.D. accepted!

## SURVEYORS:

We have a fantastic package for the TRS-80! All of the programs perform cal culations to full double precision accuracy. Here are some of the many features:
*FIELD ANGLE TRAVERSE (with stadia re duction, inverse, etc.) store a traverse, with elevations, on disk
-STADIA REDUCTION
*UNIVERSAL TRIANGLE SOLUTIONS
-VOLUME BY AVERAGE END AREA

- CIRCULAR CURVE SOLUTIONS
- HORIZONTAL CURVE LAYOUT (with tangent offsets)
- UNIVERSAL INTERSECTIONS
- VERTICAL CURVES AND GRADES
*BORROW PIT VOLUME
*COORDINATE TRANSFORMATION
-AREA FROM POINT COORDINATES
-INVERSE FROM COORDINATES
${ }^{\bullet}$ RADIAL TRAVERSE (coming soon)

Disk version (32K with Disk)

## MORE FOR YOUR RADIO SHACK TRS-80 MODEL I!

- MORE SPEED
$10-20$ times faster than Level II BASIC.
$\star$ MORE ROOM
Compiled code plus VIRTUAL MEMORY makes your RAM act larger
* MORE inStructions

Add YOUR commands to its large in. struction set!
Far more complete than most Forths: single \& double precision, arrays. string-handling, more.

- MORE EASE

Excellent full-screen Editor, structured
\& modular programming
Optimized for your TRS-80 with
keyboard repeats, upper/lower case display driver, single $\&$ double-width graphics, etc.

* MORE POWER

Forth operating system Interpreter AND compiler
Internal 8080 Assembler
(Z80 Assembler also available)
VIRTUAL I/O for video and printer, disk and tape
(10-Megabyte hard disk availabie)

THE PROFESSIONAL FORTH FOR TRS-80

Prices:
MMSFORTH Disk System V1.9 (requires 1 disk drive \& 16 K RAM) ......... just $\$ 79.95^{*}$ MMSFORTH Cassette System Vi. 8 (requires

one else coming along and copying their material and making a profit based on the simple cost of reproduction.
"We're looking here at a product; a serious amount of analysis and thought and market planning and serious investment of money goes into the development of it, and every time we look at a product in the future, we have to go through that same procedure. It's going to be very difficult (in the future) to justify software development."

In conclusion, it is the voice of Bill Gates that rings in the ear. He was asked to react to a recently published disassembler handbook from Richcraft Engineering.

Interviewer: The author provides virtually all of your code in hex, out of which he's taken a few bytes. That's to make sure that the person bought the original product.

Gates: He's got our code in hex?
Interviewer: Your entire code less maybe two dozen bytes he took out specifically to
say he didn't violate your rights by providing the whole code.

Gates: He certainly violated our rights! Interviewer: He feels he has not...
Gates: He certainly has, because that's my material! Whose does he think it is? Does he think that he has the right to go out and commercially profit by republishing something that we created? I mean, that's ludicrous! Why should he be making money from that? All he did was take our stuff!

The TRS $80^{*}$ is a great small computer. But its cassette recording system can be very frustrating, particularly if you can't read an important cassette. JPC Products Company has developed an improved cassette system that uses your present cassette recorder but operates much faster with better reliability. The TC-8 plugs into the expansion connector on the back of the keyboard and saves and loads 5 times faster! Less than

- 190

## The essence of variables.

## Into the 80's

Ian Sinclair<br>89 Alexandra Road<br>Sible Hedingham<br>Halstead, Essex CO9 3NP<br>England

IIt doesn't take long for the novelty of printing your name on the video screen to wear off. There are more interesting ways of using the TRS-80, including the manipulation of variables.
A variable is a code for something, which might be your name, your driver's license number, or any other piece of information you choose. The fact that you can change this code any time makes it variable, but once you've defined $i t$, the computer will make use of this code any time you instruct it to.

## String Variables

Using the methods you learned last time, type enter and run the program in Listing 1. There are a few new points to make here. First is the use of the dollar sign after the letter N . The letter is being used as a variable, but the dollar sign makes it a particular type of variable called a string variable. A string is simply a collection of the characters we would normally place between quotes for a PRINT command.

In Listing 1, NS (pronounced EN-STRING) is a string variable which we have declared as a code for the words, "THIS IS A STRING, $1,2,3$, TESTING". Each time we ask NS, that's what we get.
You may not realize it yet, but this is a mighty powerful instruction. It means, for example, that
you can print a phrase of up to 240 characters or so just by using the command PRINT N\$. Even better, the Level II machine lets you use many string variables.
You can use each letter of the alphabet, a letter and a number (A1S, B3S and so on) or two letters (AZS, BDS), as long as the string sign is used to instruct the computer that this is a string variable. If you leave out the string sign, the computer will normally reject any attempt to equate the variable code letter to a string of letters, because a let-
> ''These statements are called variable assignments and the equality sign doesn't mean equals when it's used this way, but rather 'takes the value of."'

ter with no string sign means that the variable is a number.

The exception occurs at the very start of a program, when you have told the computer that all variables which start with a specified letter will be string variables. This is done by using the DEFSTR (define as string) command. A program starting with 10 DEFSTR A,K,T uses variables such as $\mathrm{A}, \mathrm{AM}, \mathrm{AA}, \mathrm{K} 1, \mathrm{KZ}, \mathrm{TZ}$, TT and so on without the string sign after them.

Let's look a bit harder at this string thing. Can
we really store a long string? Try Listing 1 again, but this time make the first line read:

10 NS = "THIS IS A MUCH LONGER STRING WHICH WILL NEED MORE MEMORY SPACE THAN THE PREVIOUS ONE"

Don't change the remaining lines, but type in the new line 10, ENTER it and RUN.

## The Clear Command

So, you got an error message? Even if you typed everything correctly and didn't get the SN error message, you still get the words OS IN 10 . OS means out of string space; was Sinclair wrong? Something else you have to learn about the TRS-80 is you have to let it know in advance how much memory it needs to reserve for strings.

Normally, when you first switch on, the 80 reserves 50 units (bytes) of memory for strings. Each character of a string, and that includes spaces, remember, takes up one byte of memory, so you don't need to have very long strings to total over 50 characters. To reserve more space, use the CLEAR command at the start of a program. Try it by typing in the following line at the beginning of the program:

5 CLEAR 200
Leave line 10 as it is; ENTER and RUN. This time there should be no OS error message, because we've reserved enough string space for 200 characters. Now this may seem confusing, because when you are inventing a program you may not know just how much string space you need. That's O.K., because you don't have to enter the CLEAR instruction until your program is complete and ready to RUN, and by that time you should be able to tell how many characters are going to be stored as strings. If you forget, it's no great hassle to type in a line 5 with a CLEAR instruction, followed by a number big enough to
store all your characters. Lines are numbered in tens in order to leave room for second thoughts like this.

Why should we have to do this? Well, it's all tied up with the way the computer controls the memory space. We said in the first article of this series that it is possible to reserve space at the top of memory for machine-code programs.

This is not the only reserved space in the memory. The memory space just below the machine-code space is reserved for strings. If you haven't used a CLEAR (number) instruction, only 50 bytes of this memory are reserved. Use more than 50 bytes of string, and you get the OS warning, because you have run out of reserved space, and that part of memory is in danger of being used for something else.

Why don't we just start every program with CLEAR 2000, reserving plenty of space? Simple: It's wasteful. Reserve too much space in memory, and it's like roping off half a parking lotyou're wasting space. Memory is valuable to the computer, so we don't reserve any more than we need, especially when we're entering a long program.

The way computers use strings (called string handling) is one of the points that sets apart the serious computer from the "just fun" machine. It's the big, big improvement of the Level II machine over the Level I , for example.

The little program that we've been running gives you a taste of this. In line 40, the PRINT command asks for a print (on the video screen) of the message we've coded as NS, but also for the message ";ALL WELL." Notice the positions of the quotes and the semicolons? The semicolon immediately after NS is a command, meaning put in a space and keep printing on the same line. The semicolon inside the quotes is part of the message and it gets printed. There's nothing to show, when you look at the whole message on the video screen, that one group of characters was stored as a string and the other as a PRINT command inside quotes.

Here we should mention the matter of numbers (more in Part 5, incidentally). If a variable letter isn't specified as a string by the dollar sign or the DEFSTR command, then it's a number. We'll find later on that we can define three types of numbers, but for the moment we won't look for complications. We can write a line, such as 20 $A=15$, and then throughout the program we can use $A$ instead of having to type 15 . If we want to change it, we use another statement, such as $100 \mathrm{~A}=16$. These statements are called variable assignments, and the equality sign doesn't mean equals when it's used in this way, but rather "takes the value of."
This is very important, as you'll see later, because some statements look odd if you assume that = means "equals." Take a look at the short program in Listing 2. NS is a string variable which we set to be "GREEN BOTTLES" in line 10. The number variable $A$ is set to 10 in line 20. When we get to line 30 , we get . . . well, try it for yourself! If we now add a new line:

$$
35 \mathrm{~A}=\mathrm{A}-1: \text { GOTO } 30
$$

and RUN again, we see some wild printouts which won't stop until we press the BREAK key.

What happened? We did say that $=$ means
"takes the value of." In line 20, A takes the value of 10 , so in line 30 you get:

## 10 GREEN BOTTLES, HANGING ON THE WALL

(You did get the comma inside the quotes, didn't you?) At the new line 35, A takes the value of $10-1$, which is 9 . The colon marks a new instruction on the same line. This saves us from having to make a new line number. The next instruction is GOTO 30-go back and carry out the instruction in line 30 and go on from there. This is the PRINT instruction all over again, so you get:

## 9 GREEN BOTTLES, HANGING ON THE WALL

The program then automatically steps to the next line, 35 again. This time $A$ starts at 9 ; the instruction $\mathbf{A}=\mathbf{A}-1$ gives $\mathbf{A}$ the new value of 8 and so on. This is called a loop-the program simply goes from instruction 30 to 35 , then back to 30 again, and you can't get out of it except by pressing the BREAK key, by another program instruction or by letting it run out of numbers.

## The INPUT Instruction

We need to look now at a more immediate way of entering information into the computer. So far, every string and number we've used has been planned ahead and put into the program from the beginning. The only method we have of changing things is by re-typing the program lines (I'll talk about editing them later).

The instruction that saves us a lot of time is called INPUT, and an example of its usage is in Listing 3. Type in the program, remembering that the @ sign must follow directly after the T of PRINT, no spaces allowed, and the number of the PRINT@ position must be followed by a comma and then the first set of quotes. If you run the program, right away the screen clears, and the words:

## WHAT IS YOUR NAME

appear. On the next line a question mark appears, and the program stops, waiting. It's waiting for you to put in your name, or any other

name. You can take your time about typing a name, because the computer waits until you hit ENTER. When you do hit ENTER, your name appears with that famous phrase after it. You can enter any name, or any gibberish at the INPUT step. It will accept numbers, or mixed names and numbers like CONVICT 99, or anything else you put in. They will get printed just as if they had been placed between quotes in a PRINT command.

This is more useful, because it lets you write programs that look a bit more friendly, for a start. The TRS-80 goes further with its input command than some others, in fact, and lets you use INPUT like a PRINT statement, so you can write a line such as:

20 INPUT "WHAT IS YOUR NAME"; NS : CLS
to replace line 20 and 30 in Listing 3. Do I hear an objection? It's true that when you use INPUT to print like this, you can't place the printing where you want it, because you can't have INPUT TAB or INPUT@. Try this for line 20 :

20 PRINT@22,::INPUT "WHAT IS YOUR NAME";NS:CLS

Watch the sequence of delimiter markings in this one-after the 22 we have comma, semicolon and then colon marks. Notice we don't use a question mark after NAME, but you'll see one when the program runs, because it forms part of the reply to the INPUT command.

Suppose you try to use $\mathbf{N}$ instead of $N \$$ after INPUT? You can't do it, unless what you enter is simply a number. If you specify a string variable, you can INPUT what you like, up to 255 characters; but if you specify a number, then you must enter a number, no letters permitted.

Using INPUT statements to make a sort of conversation is illustrated in Listing 4. In line 20, your name is assigned to N\$ by the INPUT statement, and line 30 makes a friendly comment.

At line 40, the INPUT asks for age, and at line 50 for this year. The grand finale is in line 60 , when the printout on the video screen gives the name and year of birth. How? Since it has the present year, represented by variable $Y$, and your age, variable $\mathbf{A}$, it only has to subtract $\mathbf{A}$ from $\mathbf{Y}$ to get your year of birth-unless you lied about your age! Simple-but it looks like magic to anyone who hasn't seen your TRS-80 in action before.

## CLOAD and Friends

CLOAD is one of the instructions we use many times on the TRS-80. It means Cassette Load, and it's the instruction that lets you use these programs on cassette.

The freedom that cassette loading and saving gives you is immense. Without cassettes, each program you use is lost whenever you type a new program or switch off. By saving your programs on cassette you can enter them at any time.

In addition, cassettes give you a chance to run programs which might take many hours to enter from the keyboard, or which most of us could never devise even if we were locked in a padded cell for a year.
O.K. let's go over cassette loading in detail. If

IF YOU LOVE THE LIMITLESS WORLDS OF IMAGINATION, ...YOU'IL GO CRAZY FOR OUR
you bought a complete TRS-80 outfit, you'll have the CTR-80 recorder; a used TRS-80 might come with a CTR-41. I use a fairly high-grade recorder which has a better-than-normal frequency response (which means it records and plays high notes better). This is advantageous, because the recording and replaying of data and programs use high notes, and you can't load properly unless these notes are loud and clear. For example, if the tone control of a cassette recorder is set to reduce high notes, it just won't load programs.

Whatever cassette recorder you use must have a microphone input socket, automatic recording level adjustment, an earpiece output socket and a motor control. The motor control takes a small ( 2.5 mm ) jack plug, the smallest plug on the TRS-80 cable, which comes from the cassette outlet on the TRS-80 keyboard.

The signals out of the cassette recorder come from the earpiece socket, a 3.5 mm one, which is linked by pushing in the black plug at the end of the TRS-80 cassette cable. For loading cassettes, you don't need the microphone plug (the grey one), but it looks neater if you put it in place, so in it goes to the microphone input of the recorder. Check them all again.

If you are not using the CTR-41 or CTR-80 recorders, then whatever you use must have the same plug-in arrangements, particularly the motor control, because the recorder motor is controlled by the computer. If you bought only the TRS-80 keyboard and are using your own cassette recorder (or reel-to-reel recorder), then you will have to make or buy adaptor leads.

If you are using the CTR-80 from Radio Shack, then the recorder will run fast forward or fast reverse even when the computer has stopped the motor from running in the play or record/ play settings. If you are using the CTR-41 or any other cassette recorder, you won't have this rather useful facility. For some program work, it won't matter, but if you would like to go from one place on the tape to another, then there are various fixes. A few user-group magazines will show you how to cut tracks inside the recorder to do this.

My own fix is illustrated in Fig. 1. It consists of an adaptor box and a small switch which allows either normal or computer control of the recorder motor. With this addition, you can also use manual control with the cassette recorder switched to play, which is useful for finding a short gap between the programs on the tape. If you start a playback in the wrong place on the tape, it won't load correctly and the program won't run. If hardware doesn't interest you, the easy solution is to type:

10000 OUT 255,4: GOTO 10000

ENTER this and RUN, and the motor will stay switched on by the computer until you press BREAK.

## Loading the Program

So we've sorted out our recorder, everything's plugged in, and we're ready to go. Next, we need a BASIC program on a cassette. My TRS-80 came with Radio Shack's blackjack program, and it's likely that yours did too. If not, then you'll need some software.

```

Listing 4.

Pop the cassette into the recorder, with the program you want to load, so that the label of the wanted program is uppermost. Rewind the tape completely-the CTR- 80 will make a moaning noise when the rewind is complete.

Set the volume control of the recorder to halfway between its maximum and its minimum settings. Make sure that the tone control, if you have one, is set to give maximum treble.

Now we're ready. Type CLOAD on the TRS-80 keyboard, press play on the recorder and press ENTER on the keyboard. You should hear the motor of the recorder start to hum. If the motor starts when you press play there's a fault in the motor circuit somewhere. The motor-control jack may not be plugged fully in. If the motor doesn't start at all, then perhaps there are no batteries or the power line isn't plugged in. These are what we call hardware problems.

Another possible hang-up could be a software one. Are you sure that you typed CLOAD? Keybounce, which may have given you CCLOAD or CLLOAD won't be accepted by the computer, and it will snap back with an SN error when you hit ENTER.

By now, if all has gone well, the cassette should be running. Unless you have connected the loudspeaker of the cassette recorder so that you can listen to the tape as it plays, you won't know when the action actually starts, until you see things happening in the top right-hand comer of the monitor.

Two asterisks appear once the program starts loading, one steady, the other flashing slowly. One asterisk flashes at the rate of loading program lines, on for one line, off for the next. If you're loading a short program with short program lines, the rate of flashing will be rapid, and it won't be long before a click comes from inside the keyboard unit, the cassette recorder motor stops, and READY appears on the video screen.

If all this happens, you have achieved a successful load first time, and you qualify for the Fort Worth Perfboard Medal of Honor.

It's much more likely, first time round, that things won't run quite so smoothly. There are two extremes to the problem. One is that no
asterisks appear at all. This could simply be due to a tape which starts only after a long leader. which is why it is so useful to have a loudspeakes tone; but if there is no trace of the asterisks after a minute, there is replay volume trouble. Despite what the manual may say, this indicates that the replay volume is either much too low or much too high. If, on the other hand, you get two asterisks, but the right-hand one isn't flashing, then it's a dollar to a cent that the replay volume is just a little bit too high.

## Cassette Control

If you have either of these problems, you'll soon find that you have another one as well,the cassette recorder motor keeps humming away happily until it comes to the end of the cassette, or until you do something about it. It certainly won't stop at the end of the program load, because the stop instruction was never loaded into the computer. You can waste a lot of time just waiting for a cassette to load, so keep a careful eye on these asterisks. If they aren't blinking properly, then press the RESET button at the back of the computer, rewind the cassette, press CLEAR to remove the old instructions and asterisks and start again with a different volume control setting.

Don't give up if you overshoot and go far too high or far too low. When I bought my first TRS-80, I spent the better part of an afternoon trying to achieve a good load. Since finding the correct settings, it has never at any time failed to load a good cassette. You don't need to use expensive chrome-dioxide tape material, just reasonably good quality audio tape, like Agfa or TDK. It's definitely an advantage to use tape sold in short lengths for computer work, but the C60 length is very useful when you're developing a program with several versions.

You may find that you have a tape which simply won't load under any conditions. The odds are that it's a tape intended for a Level I machine. Once again, if you have the sound wired on your cassette recorder, you can check this, because the Level I tapes have a lower pitched note and sound quite different.

Fig. 1.

IMAGINE.
A computer game that has drawn the attention of the national news media.
A computer game that has people around the world clamoring for it.
A computer game that turns your love life into a menage a trois. you, your mate, and your computer!

That's interlude-the hottest new software program for personal computers.

But it's more than just a game. It's an experience that will tantalize you...romanticize you...fantasize you...and often surprise you.

Interlude begins with a unique computer interview of the participants to determine their mood. Then it searches its memory to select the best Interlude for the occasion. You may be referred to the instruction manual which describes most of the 106 Interiudes, or your instructions may appear on your screen if you've chanced to hit upon one of the many surprise Interludes buried within the program. (When you discover secret Interlude \#99, your love life may never be the same again!)
Interlude... it's fun...it's fanciful ... it's fantastic. It's the computer game for adults. Are you ready for it?

Once you have found the correct setting for the Radio Shack blackjack tape, or whatever you use for trials, try to find the limits of the volume control settings. It takes a lot of patience, but it's worth your while on the older models (later models are more tolerant of volume control settings). Load the cassette at different settings checking only for a few seconds that the asterisks are flashing correctly, then use RESET to stop the tape and rewind. You should end up with two marks on the volume control, one at the lowest position at which a tape will load, one at the highest.

Set the volume control for normal operation midway between your marks. If you then find a tape doesn't load correctly at this midway setting, try it at each of the extreme settings. If it won't load on any of your marked range, reject it. One final check: Make sure it is a BASIC tape and not a machine code (system) tape, which requires quite a different technique (coming up).

When you have loaded your BASIC tape, type LIST and hit ENTER. The program will now list, unless it's one which has been specifically coded to prevent copying. As the program lists, it will scroll up the screen fairly rapidly.

You can stop the scrolling any time by hitting SHIFT and © at the same time, so I usually keep one finger on the shift key and another on the@ key to stop and start the scrolling. Any other key can be pressed to restart scrolling.

I didn't say what scrolling means? When you've seen it, you'll know-it's the way the listed lines appear at the bottom of the screen, seeming to push previously listed lines off the top of the screen.

What you should be looking for in the listed program is corruption-gibberish lines, sometimes with no numbers or numbers out of order. Trouble is, until you get to know a bit more about programming, you don't really know a strange line from a perfectly good one! The real test, of course, is to run the program. If it operates perfectly, then there is nothing wrong with your cassette recorder volume control setting, and you can look forward to a long, active computing life.

Just keep your head clean. I mean, of course, the record/play head of the cassette recorder. Get a pack of cleaning fluid (isopropyl alcohol) and cleaning pads and use them as per the instructions every three months or so, depending on how much tape you use. Don't be too generous with the fluid, as it can sometimes swell the plastic bearings inside cassette recorder motors.

## Loading System Tapes

While we're on the subject of this cassette loading caper, we might as well look at how machine code tapes are loaded. A machine code, or system tape usually comes with a bit more information than a BASIC program tape.

For one thing, you'll need an answer to the MEMORY SIZE question which appears when you switch on. This is a number, such as 32000 , that reserves some memory. The system tape, or the instruction sheet which comes with it, should have the correct number printed on it. If the program is one which doesn't need reserved memory, or which reserves its own, the instructions will say so.

Hit ENTER and the usual Radio Shack
message comes up, with READY. Next, type SYSTEM, and hit ENTER again. This time, you'll get an asterisk and a query at the left-hand side of the video display. That's 80 language for, "What's the code name for the tape?"
The code name will have up to six letters and must be typed. For example, the Radio Shack fix tape for keybounce has the code name KBFIX. When you've typed the name, prepare the cassette recorder to replay, press the play key and hit ENTER. The cassette recorder motor will start, and, if all is well, you should see the usual asterisks to indicate that you are loading your first machine code program. The rate of flashing is usually a lot slower than it is for a BASIC program, so don't worry if the load stops after only a few slow flashes.
Now what can go wrong? Well for one thing, the code name which you typed may not be the code for the first program on the tape. If it isn't, the left-hand asterisk will be replaced by a letter. If that letter is C , then you have trouble, and you'll have to try again with a different volume setting. Hit the RESET switch to stop the action, rewind the tape, clear the screen and start again by typing SYSTEM. You don't have to switch off and answer the MEMORY SIZE question again.
Next question: Having loaded it, how do you run it? When the tape has finished loading, the recorder motor cuts out, the asterisk stops flashing, and another asterisk and query appear under the first one on the left-hand side of the monitor. Type a slash (/) and then the entry number of the machine code program.
Machine code programs are not so simple as BASIC programs in this respect: You have to instruct the computer where to start working. The entry number should, once again, be noted either on the cassette or on the instruction leaflet. It may be the same as the number you used to answer the MEMORY SIZE question. When you've typed the slash and the number, hit ENTER and your machine code program will run.

Suppose you quit using one machine code program and want to start using another one which needs more memory roped off? You don't have to switch off to do this. Just type SYSTEM, hit ENTER and when the asterisk and query appear, type slash and 0 and hit ENTER again. The MEMORY SIZE question will appear again. You'll lose any BASIC programs you had in store, though, so if you have mixed BASIC and machine code, make sure that you have the BASIC program on tape.

A few machine-code programs are "selflocating." Once you have loaded them in by typing their code names and entering, the second step is just to type the slash and hit ENTER. Whatever type of machine-code program you may be using, don't forget the slash. Otherwise, you'll find that when you hit ENTER, the cassette motor starts running again, trying to enter another program, and you'll have to recover control by using the RESET button. You'll probably lose the program which was loaded, but you can start again.

## Recording Programs

We've left until the end the matter of recording BASIC programs of your own. You'll want to record your own programs, of course, to remind

yourself how good you are. You'll also want to make back-up copies of software you've bought, just in case anything should happen.

How do you record a program? The first step is to prepare a blank cassette. Don't think you can re-record an old tape in the same cheerful way you may be used to with audio cassettes. You might get away with it, but odds are you won't, and your recording will be corrupted. If you want to re-record a tape, wipe it completely with a bulk eraser. If the program you want to record has taken you a long time to run correctly, you won't want to trust it to anything but a length of good quality fresh tape.

Reel the cassette back to the start and take a look at it. If there's a leader, a piece of clear or colored plastic tape at the beginning, advance the tape a bit until the grey magnetic coating is visible. I usually run each tape for a count of five on the tape-footage counter. Don't touch the tape; it will leave a greasy mark which can cause loading problems later. Place the tape in the machine again, note the counter setting and press the record and play keys. A few cassette recorders use one single record key, but most use the safer system of needing two keys for recording.

The volume control setting doesn't matter, because recording volume is automatically controlled, unlike replay. Now type CSAVE and a quote mark, then a letter and another quote. If you choose " $A$ " as the letter, this will appear on the screen as CSAVE " $A$ ".

If you don't use the code letter, the computer will reject your attempt to record, but only after it has already recorded a signal on some of the tape, which you won't be able to use again, unless you can erase it thoroughly.

When you're satisfied that all is well, hit ENTER, and the program should start to record. There are no flashing asterisks to remind you this time, just the quiet hum of the motor of the cassette recorder until it clicks off at the end of the recording. The click, incidentally, comes from the relay inside the TRS-80. At the end of the CSAVE, READY appears on the screen.

At this point, don't start shouting eureka and running around. You don't know yet that you
have a good recording. Rewind the tape, type CL.OAD?"A" (or whatever letter you used) and press play on the recorder. Then check again that the query mark has been typed after CLOAD; hit ENTER and wait. The program will play back, with the usual flashing asterisks, but this time the replayed program is being compared, byte by byte, with the program which is still in the memory of the computer.

If they aren't identical, the mesage "BAD" will be displayed. You have then to sort out whether the tape copy is faulty, or you need a different volume control setting for this program. Only when you've CSAVEd and CLOADed with no error messages can you be sure that you have a good copy of your program. Cautious people always make two recordings, checking one with CLOAD? People like me who shed blood, sweat and tears to create a program always make three copies.

Be very careful that when you use the CLOAD? command, you don't leave out the query mark. If you do, the program on tape will load, replacing the program that was in the computer. If the recording was good, this won't matter, but if the recording was bad, you have lost the good original and have a bad copy, and that just isn't fair trading.

## The CSAVE Instruction

Very little ever seems to go wrong with a CSAVE instruction, but there are a few points you will need to remember. One is that the computer can only control the motor of the cassette recorder; it has no control over the rest of the recorder.

If, for example, you use CSAVE but forget to press the record and play keys of the recorder, or press only one of them, then the computer will push out the recording just the same, with no warnings and no recording made. It might be useful to arrange it so that you got an error message, but this would need more connections between the computer and the recorder and would make the recorder a non-standard item.

You should always use CLOAD? after a CSAVE, so you can check that you really did
record that program. A much worse fault is to type CLOAD and run with the record and play keys down. This way you load no program, and you wipe out anything which was on the tape!

When you CSAVE a program, you have to use a letter or a couple of letters of let-ter/number-it's like choosing a name for a variable. If you don't, as we've said, the CSAVE will not run, an SN error will be displayed, and the tape will be corrupted.

The label is called a filename, and it's important to the recording. It's used when you CLOAD the program, and it's particularly useful when you have several short programs packed together on a piece of tape. Suppose you have three programs on the start of a C15 cassette, and they have been labelled " $A$ ", " $B$ " and " $C$ " at the time they were CSAVEd.

When you CLOAD, you can type CLOAD?"B" and hit ENTER, and start running the cassette from the start. When the first program starts to replay, the left-hand asterisk will be replaced by the letter A to show you that this is the filename (the first letter if there's more than one) of the program which is being read. The other asterisk will flash normally. When the program which you have requested comes on line, it will load in the usual way, with one steady asterisk and one flashing one, then the recorder will switch off.

Normally, when I keep several programs on one cassette, I leave plenty of space between and use the tape counter to find each one, but I find this "label-search" very useful for my backup cassette, which is a C60 with all my most valuable programs stored tightly together. Since I use this only when a valuable program has been wiped or corrupted (and I' $m$ resting the other backup cassette), it doesn't matter if it takes twenty minutes to find the program.

One last point-always start a replay either at the start of a cassette or at a point where you know there's no program recorded. If you start running where there's a program recorded, the load will be faulty, and the computer can lose control of the motor. You'll end up having to use the RESET button and rewinding the tape.

These popular, professionally developed applications are low-priced. Guaranteed performance! Detailed booklet included.

## TUTORIAL

## Let's look at the management instructions involved and how to use them effectively.

## Pulling Strings Together

John D. Adams 13126 Tripoli Ave. Sylmar, CA 91342

My first article on strings outlined their concept. The following examines string management instructions.
The TRS-80 handles string and non-string data in different ways. These two types of data are not interchangeable on Level 1 systems.
Level II, however, gives us a way to get around the problem with two instructions: VAL( nS ) and STRS( n ).

## VAL(nS) and STRS(n)

These two instructions permit us to use data stored as strings in non-string operation and vice versa. The instructions are quite easy to understand. Let us assume that we have " 12345 " stored in location AS and " 54321 " stored in location BS, and that during the execution of a program we need the sum of the two numbers. Enter and RUN the following:

10 READ AS.BS
20 DATA 12345,54321
30 PRINT AS + BS

Note what line 30 produces. Since the numbers are in memory as symbols rather than values, the computer did not return their sum, but their concatenation. Is there a way to get a sum from these numbers? Change line 30 to read:

This produces the needed sum. The VAL statement has instructed the computer to use the values of the strings. By including the line $C=V A L(A \$): D=V A L(B \$)$, we store the numbers in memory as values C and D and as strings in A\$ and B\$.

STRS( n ) accomplishes the reverse. Should there be a number in memory as a value and it is needed for use as a string or as part of a string, this instruction converts it. Numbers can be converted either way, that is, from symbol to value or from value to symbol, but we cannot do the same thing with letters. RUN the following lines:

$$
\begin{aligned}
& 10 \mathrm{AS}=" \mathrm{ABC} ": \mathrm{BS}=" \mathrm{ABC} 123 ": \mathrm{CS}=" 123 \mathrm{ABC} " \\
& 20 \text { PRINT VAL(AS) } \\
& 30 \text { PRINT VAL(BS) } \\
& \text { 40 PRINT VAL(CS) }
\end{aligned}
$$

The first two lines of the printout return zeros, since they start with letters. Line 40 , however, prints the numerical portion of the string. Letters do not have value, so they are ignored by the instruction. (Letters do have ASCII code numbers, but they are for identification only and have nothing to do with numerical value.) This feature distinguishes between strings starting with numbers and those starting with letters, as in the following lines:

10 INPUT"ENTER ANY STRING, EITHER NUMBERS OR LETTERS";AS: $=$ = VAL(AS)
20 IF B $=0$ THEN 30 ELSE PRINT B:GOTO 10
30 PRINT"STRING STARTS WITH
LETTER - CANNOT RETURN VALUE":GOTO IO

STR\$(n) works the opposite way. Try these lines:
$10 \mathrm{~A}=1970: \mathrm{B}=1980: \mathrm{AS}=$ "TOTALS FOR":BS $=$ " TO" $20 \mathrm{CS}=\mathrm{AS}+\mathrm{STRS}(\mathrm{A})+\mathrm{BS}+\mathrm{STRS}(B)$ 30 PRINT CS

The numbers 1970 and 1980 are stored as values, but line 20 allows them to be incorporated into CS, using the STRS instruction.

The LEN(n§) instruction counts the number of characters in a specified string, including spaces, punctuation marks, symbols, etc. It counts leading or trailing spaces only if they are included as part of the string. We have to watch out for this when numbers have been converted to string data by the STRS instruction. These lines illustrate the problem:

$$
\begin{aligned}
& 10 \mathrm{~A}=12345: \text { BS }=" 12345 " \\
& 20 \mathrm{AS}=\text { STRS(A) } \\
& \text { 30 PRINT LEN(AS) } \\
& \text { 40 PRINT LEN(BS) }
\end{aligned}
$$

Why do we get a different count for the two strings? Remember that when the TRS-80 prints a number, it always leaves one leading space for the sign, whether it is needed or not. This space explains the greater count, as it was transferred to the string. We will put this instruction to use after we have looked at the three statements which follow.

## LEFTS(nS, $\mathbf{n}$ ), RIGHTS( $\mathbf{n S}, \mathbf{n}$ ), MIDS( $\mathbf{n S}, \mathbf{n}, \mathbf{n}$ )

These functions can be used to "excerpt" a string. Using them, we can pick up any portion of an existing string to use elsewhere. Each of them has information, called the "argument," enclosed in parentheses. In the LEFTS instruction, the first term of the argument states the name of the string we want to excerpt, followed by a comma. The second term indicates the number of characters we want picked up, start-
ing with the leftmost character. An example follows:

## 10 AS $=" 12345 "$

20 PRINT LEFTS(AS,1)
30 PRINT LEFTS(AS.2)
40 PRINT LEFTS(AS,3)
50 PRINT LEFTS(AS,4) 60 PRINT LEFTS(AS.5)

The printout illustrates what LEFTS does. RIGHTS does the same thing, but starts counting backwards from the rightmost character. Add the following lines:

70 PRINT RIGHTS(AS.I)
80 PRINT RIGHTS(AS,2)
90 PRINT RIGHTS(AS.3)
100 PRINT RIGHTS(AS,4)
110 PRINT RIGHTS(AS.5)
The printout shows that we can use these two statements to "pick off" any desired number of characters from either the beginning or the end of a string. In both of the instructions, the second term of the argument (number of characters) may be a number or a variable. If, for example, the number four is stored in memory location $X$ the statement LEFTS(BS, X) will excerpt the first four characters of the string in location BS. Should the second term of the argument be larger than the number of characters in the string, the entire string will be returned.

The third statement, MID\$( $n \$, n, n$ ), excerpts portions from the middle of an existing string. There are three terms in this argument. The first indicates the string to be used, the second represents the position at which the lift is to start, and the third indicates the number of characters to be lifted from that starting point.
MIDS(A\$,12,7) returns seven characters from string AS, starting at position 12 . The second and third terms may be variables such as MIDS(LS, $X, Y$ ) in which numbers stored in $\mathbf{X}$ and $Y$ determine the starting point and the number of characters to be returned. A simple routine is given in Listing 1 to illustrate the use of these three instructions. It also uses the LEN(n§) instruction.

Line 10 clears the screen, defines variables and deposits a comma in string location $\mathbf{A}$. Lines 20-40 request your name and, using concatenation, build the string in location $B$ (shown in line 45).

The number of characters in the string is now counted by the LEN(BS), and that number is stored in location X. Lines 50 and $\mathbf{6 0}$ set up a FOR-NEXT loop which, using the MIDS instruction, examines each character in the string starting at position one, character one, and continues until it finds the period after the middle initial.

At this point, execution proceeds to line 70. Here the RIGHTS instruction stores the last name in E1 and then line 80 uses the LEFTS in-
struction to store the first name and middle initial in E2. Line 90 prints out the results. These statements allow almost unlimited flexibility in the construction and use of strings. Experiment with them a little.
The FRE( $\mathrm{n} \$$ ) instruction may be used either in the command or the execute mode and returns the amount of string storage space available at that point. It requires an argument in parentheses, but the argument is what is called a "dummy" argument. To get an idea of how this works, load and run the routine in Listing 1. After the printout, type $\operatorname{FRE}(A)$, hit ENTER, and the computer will return the number of string space bytes left after entering your name.
The argument $\mathbf{A}$ is a dummy; you get the same return if you enter B, C or any other string variable name, even if it is not in use in the program. Try using different variables. If you use a non-string variable in the argument, the computer returns the number of bytes left in RAM. Enter $\operatorname{FRE}(X)$ as an example.

This instruction is very useful in building programs where there are a lot of strings, and you want to keep track of how much space is left. This routine is an example:

> 10 CLS:CLEAR 100:DEFSTR A,B
> 20 FOR $I=1$ TO 20
> 30 INPUT "ENTER NAME":A(I)
> 40 PRINT"YOU NOW
> HAVE";FRE(A);"BYTES
> OF STRING SPACE LEFT" SO NEXT

## STRINGS (n,character)

Useful in graphics applications, we can instantly create strings of up to 255 repeated characters with this statement. Any letter, digit or symbol on the keyboard may be used, although the ASCII code numbers must be used for the quote mark, comma and colon. The first term of the argument sets the number of characters wanted in the string, and the second term indicates the character itself, or the string location in which that character is stored.

- To print a specific character, use the form PRINT STRING ( $50,{ }^{\prime \prime *}$ '). Here the desired character must be enclosed in quotation marks. - To print a character stored in a string location, use the form PRINT STRING $\$(50, A \$)$. The variable location name (AS) is not enclosed in quotes. That character must, of course, have been previously stored in AS.
- To print a character using its ASCII code number, use the form PRINT STRING $(50,58)$. As 58 is the ASCII number for the colon, this command will print a string of 50 colons. The ASCII code number is not enclosed in quotes. Using these codes, any character may be printed, including the graphics patterns which are ASCII numbers 129 through 191. All of the code numbers are listed on pages $\mathrm{C} / 1$ and C/2 of your user's manual.
One of the advantages of using this instruc-
tion is its speed of operation and printout. To see the difference, enter and RUN the following lines:

10 CLEAR 500 :INPUT"ENTER CHARACTER
TO BE USED" ${ }^{\prime}$ AS:CLS
20 FOR $\mathrm{X}=0$ TO
254:PRINTTAB(X)AS: NEXT
30 PRINT " ":PRINT
40 PRINT STRINGS(255,AS):GOTO 10
For formatting output, strings may be prepared to make borders, single lines for column totals using the minus sign, double lines for columns using the equal to sign, etc., and then quickly called as subroatines.

## ASC(nS) and CHRS(n)

In the first part of this article, string comparisons were discussed. At that time, we took a brief look at the ASCII codes. Level II offers two instructions which allow us to operate with these code numbers, if necessary. The ASC(n\$) statement gives you the ASCII code number of the first character of the string that you have specified as the argument. As with other instructions in this group, the argument is enclosed in parentheses. If you want to have the ASCII code of a character returned, and you enter the character manually from the keyboard, it must be in quotes. Entering PRINT ASC("A") returns 65, which is the code number for $A$. When the character is stored in a string location, the quotes are not used. An example would be:

$$
\begin{aligned}
& 10 \mathrm{AS}=" 5 " \\
& 20 \mathrm{PRINT} \text { ASC(AS) }
\end{aligned}
$$

Running these two lines returns the number 53 which is the code for the digit 5 . All code numbers are returned in decimal notation. CHRS( $n$ ) performs the reverse operation. In this case, the argument is the ASCII code, and the character itself is returned. Entering the command PRINT CHRS(91) causes an up arrow to be printed on the video monitor. This is a powerful function, as it permits us to print characters not normally accessible from the keyboard.

We know that we cannot use quotation marks inside a statement to be printed, because the computer interprets the second mark as the end of the line to be printed. Such signs are called delimiters. If the use of quotes is necessary in a printed statement, it may be accessed by using the CHRS statement. Type the following command.

PRINT"THIS WILL ALLOW ";CHRS(34);"QUOTE MARKS";CHRS(34);" TO BE USED"

No spaces are included with this command, and they must be provided as in the above after the word "allow" and before the word "to".

Since the down arrow is used for line feed, the left arrow for backspace and the right arrow for tabbing, we cannot print them in the normal manner. Using their codes, however, which are 92,93 and 94 , respectively, we may print them by using a line such as:

PRINT CHRS(92);CHRS(93);CHRS(94)

All of the graphics characters may be printed using their ASCII codes. Be careful when using these codes, as numbers 0 through 31 are assigned to various control operations. RUN the following lines.

```
10 PRINT"FIRST LINE"
20 PRINT CHR$(13)
30 PRINT"LINE 20 HAS CAUSED A LINE
    FEED TO BE EXECUTED'
```

These codes are quite useful, especially when working with printers.

## INKEYS

The last of the instructions we will look at is INKEYS. As the TRS-80 does not come with
joystick-type input devices, this instruction is very useful with real time games, allowing the operator to enter information while the program is running without using the ENTER key.

INKEY\$ causes the computer to scan the keyboard many times per second to see if any information has been entered. If data is found, program execution continues; if not, the search continues. When a character is entered, it is scooped up and stored in a string location, and the scanning procedure continues. The following lines illustrate this function:

```
1 0 \text { CLEAR 200:DEFSTR A.B}
20 CLS:PRINT"ENTER A MESSAGE. WHEN
    FINISHED ENTER A SLASH BAR'
30 A = INKEYS:IF A = ''''THEN 30
40 IF A = '"/'THEN 80
50 CLS:PRINT A
60 B = B + A
70 GOTO 30
80 CLS:PRINT B
```

Line 10 clears string space and defines $\mathbf{A}$ and $B$ as string variables. Line 20 requests a message and defines the slash bar as the "ending" character. Line 30 sets up the INKEY\$ scan. It
is a closed loop which continues cycling until something is entered from the keyboard. The empty quote marks ('‘’) in line 30 are used to designate a null string, or one which has no characters in it.

When a key is pressed, line 30 also deposits that character in string location $A$, and program execution continues. Line 40 tests for the ending character, and if the test fails, line 50 prints the character entered at position 0 on the monitor screen. Lines 60 and 70 then build the string using concatenation.

Execution now returns to line 30 for further entry. When a slash bar is entered, it is detected by line 40 , which causes a branch to line 80 for printout and termination. As mentioned, this function bears much investigation to fully realize its potential.
Chapter 5 of the Level II manual starts with the words, "Without string handling capabilities, a computer is just a super-powered calculator." Though this is an exaggeration, using strings makes possible operations which simply cannot be done on a programmable calculator. And the further we dig into these instructions, the more obvious this becomes.

## THE WAIT IS OVER

Now for the first time, Cpaids, is making available its Federal 1040 Tax package for the TRS-80 Model II.
Featuring-1\% and 3\% medical limitation incorporated, auto checks for FICA over withholding, auto earned income credit. auto dividend exclusions, types tax preparer's Fed. ID and SSN; proformas all forms for subsequent years

Schedules - A, B, C, D, E, F, G, R/RP. SE, TC, ES

Forms - 2106, 2119, 2210, 2441, 3468 , 3903, 4625, 4972, 4726, 4797, 5695, 6521

Requires 64 K with dual disks using CP/M.

## 37 TECHNICAL PROGRAMS TO LET YOU SPEND LESS TIME ON ROUTINE CALCULATIONS, STATISTICS, AND ANALYSES...MORE TIME ON CREATIVE DESIGN AND ENGINEERING.

Sams-the leader in technical publishing-now offers the most advanced engineering software systems available. These tested, documented, debugged programs can be used as stand-alone programs or as subroutines for more complex programs.

FASTER INFORMATION - Solve simultaneous equations with real and complex coefficients and polynomial roots. Quickly determine the effects of an infinitely variable set of design parameters. Plot graphs for various functions while varying scales to fit data.

EASY TO RUN-7 cassettes include 37 debugged programs.

- FULLY DOCUMENTED-Easy-to-read and follow instructions.

DESIGNED FOR POPULAR MICROCOMPUTERS - Designed for use on TRS-80* systems having Level II BASIC and at least 16K RAM; many of the routines can be adapted to run on other popular computers. Programs will be available soon for Apple and Ohio Scientific.

PROGRAMMED, TESTED, AND DEBUGGED BY HOWARD M. BERLIN - Howard M. Berlin-an author in the Blacksburg Series - is on electrical engineer with the Chemical Systems Laboratory at Aberdeen Proving Ground, Maryland, and has been adjunct instructor in the Department of Electrical Engineering at the University of Delaware.

## Small Business Inventory System

## Accounting information Order entry Inventory control Invoicing

Westech's Small Business Inventory System is a powerful and comprehensive inventory / accounting package for the TRS-80. Order entry, goods on hand, inventory control, inventory replacement and restocking procedures are all organized with the aid of the system.

SBIS will handle credit card and layaway sales, order cancellations and discounted sales. Complete lists of all inventory detailing product type, quantities and item code numbers can be printed whenever required. Information available to the operator of the system includes part numbers, item descriptions, product codes, list prices, costs, average costs, quantities on hand, physical locations, when to re-order and who the vendors are.

Items that are 'lost' can be traced with the aid of a unique search routine. It will maintain data regarding lot quantities, quantity of sales year-to-date, sales for last year, item numbers and when an order is due to be delivered. SBIS stores and maintains accurate daily, monthly and yearly sales figures.

Storage capacity? As many as 10,000 different line items may be stored on a TRS-80 Model One having four 77 track drives. Capacity with four 40 track drives is 5,000 line items and 2,200 on just two 40 track drives. The TRS-80 Model Two will handle about 25,000 line items. Sorting and looking for items is very fast, as Westech's SBIS utilizes machine language in-memory sort routines. The system requires 32 K , two disk drives and a suitable printer (for permanent records).

A complete Model One documentation manual and demonstration disk is available for $\$ 35$ (which is deductible from the purchase price of $\$ 545.00$. SBIS is also available for the Model Two for only \$595.00-a demonstration disk and Model Two documentation is $\$ 40.00$ (also deductible from the purchase price of the system).

See your nearest IJG Authorized Dealer for more information on this exciting SBIS time and money saving system.

## random access data exccutive

The I.J.G. Random Access Data Executive (RADEX10) is a sophisticated database management system. Written in disk BASIC, the program enables you to create and manipulate databases with up to 10,199 records, any of which can be accessed within seconds. The minimum system required to use RADEX-10 is 32 K of memory and 2 disk drives. A printer is not needed to use the program.

RADEX-10 enables you to create and manipulate databases easily and quickly, without any programming. You can use RADEX-10 to maintain any type of file or record requiring fast access and maximum use of disk space. As a self contained system RADEX-10 is almost self-explanatory. All operator prompts and messages are in plain english - not computerese.

The standard system consists of six program modules, which load and execute automatically as required. You can create files, add data, remove data, change data, generate reports, produce mailing labels (if you have a printer) and generally manipulate your data - all without writing a single program line!

All of the program modules are designed to handle specific tasks within the system. The modules are designed to be 'transparent' to the user, all file creation and manipulation being taken care of automatically.

The Report module is one of the most flexible and powerful available for a TRS-80 database system. It allows you to search all the records, or a selected range of records, and list only the records that meet the conditions specified. You can specify up to 30 separate conditions that a record must meet, and any of the conditions can be applied to any separate part of a record. Conditions that can be selected are; equal to, greater than, less than or alphanumeric match (on alphanumeric parts of records). Logical operators AND, OR, AND NOT and OR NOT can also be performed on the specified conditions.

After the conditions for a report are specified they are stored on disk, so that you can have several different reports available on the same data.

Reviewed in the July issue of 80 Microcomputing, RADEX-10 comes with a 40 page manual and will operate with TRSDOS or NEWDOS. Versions are available for 35,40 or 77 track disk drives. This extremely versatile system is only $\$ 99.00$, the manual is available separately for $\$ 15.00$ (with full credit towards program purchase).

## C.A.S. Report Sort Module

This new add-on module for RADEX-10, or the Universal Database Manager, allows you to sort your RADEX-10 database on any field and output the result to a printer or the screen. The report will also be sorted on any specified output field. A high speed in-memory machine language subroutine, especially developed by RACET computes, is used to perform the sorts.

## C.A.S. Database Sort Module

Using this module you can sort your entire RADEX-10 database, or portion of the database, on any field. The sorted records can be output to a new file, or appended to the existing file. You can select the records to be sorted with both relational (greater than, less than, equal to or alphanumeic match) and logical comparisons. In this way you can create new RADEX-10 files containing subsets of the main database. A high speed machine language subroutine is also used in this module.

## C.A.S. Database Editor

If you need to add, delete or change any fields in your RADEX-10 database, without re-entering all the existing data, then this program is the answer. With it you can completely restructure or edit your database with ease, make fields longer or shorter, change the sequence of information, or even insert completely new fields.
All the modules work with either RADEX-10 or the Universal Database Manager, but require 48 K and NEWDOS.
Complete with extensive documentation, the modules are available to registered RADEX-10 or Universal Database Manager owners for $\$ 99.00$ each.

## A peripheral worth considering.

## The Light Pen

Hugo T. Jackson \#401-1873 Nelson St. Vancouver, B.C. V6G 1M9

3G Light Pen<br>3G Company<br>Gaston, OR<br>$\$ 34.95$

Perhaps the following scenario sounds familiar? Excited by the prospect of using your recently purchased computer for a business application, you diligently apply yourself to the task of writing your first program. Although it's hard work, you stick with it, emerging months later with the completed program in hand. You're eager to show your business partner or employee how to use and appreciate the sum result of your newfound knowledge.

You grow increasingly frustrated, however, when his trial attempt at the keyboard results in input errors, causing the program to bomb unmercifully. You quickly realize that if he is going to have any success with the computer, he will have to know as much about the machine as
you do. That's an expensive proposition, even if it's only your time that's spent training him.

Your first home application isn't that successful either, if, like myself, you had intended to develop some educational programs for a child of six. Have you ever tried to explain "SYNTAX ERROR IN 140" to a child who can't even read?

## The Light Pen

Fortunately, there is an answer to the problem, and it is called a light pen. What this marvelous device does is specify locations on the video monitor simply by placing the pen point directly over them.

The pen is quite simple, and, although designers may employ different refinements, they are all built on the same basic principle.

In the tip of the light pen is a photocell, phototransistor or similar electronic device. These components are all light sensitive. The pen's circuitry differentiates between two levels of light.

In computer applications, this translates to the pen's determination of whether or not a particular screen location is illuminated (by a letter or graphics character) or blank.

Aware of a light pen's potential, I reacted quickly to an
advertisement from the 3G Company. After three and one-half weeks-interrogating the post-
man daily-the light pen was fi nally delivered. Opening the well-packaged container, I

found a demonstration program on cassette, two sheets of instructions and the light pen.

Wonder of wonders, the program loaded the first time, and when I ran it, the familiar tic-tactoe grid appeared on the screen.

Although the pen's instructions indicated that my monitor might require adjustment of the contrast and brightness controls, I was happy to discover that the levels at which I usually have the monitor set were quite acceptable.

While tic-tac-toe is popular with my son, it is not the most intriguing game that I have ever played, so it wasn't long before I began thinking of other applications for the light pen. To ensure success, I first had to understand exactly how the pen worked.

## Polling the Port

The light pen is assigned a port address of 99 and is controlled in BASIC programs with the INP and OUT commands. Using either equivalence ( $A=$ INP(99)) or conditional (IF INP(99)>128 GOTO 1310) statements, the program polls the port address of the pen and returns with either a value of 127 or 255 . This indicates whether the light pen is on an unlit or itluminated portion of the screen.

However, before the port is polled, it is necessary to reset the pen logic, as the circuitry latches and holds high state logic; i.e., once the pen has been triggered, it returns a value of 255, whether or not it has been subsequently moved to an unlit portion of the screen. The statement OUT 99 resets the pen and

faster And More Efficient Than:

- TRSDOS
- NEWDOS +
- VTOS

DOSPUUS Uses less memory and still offers all the commands of the other major operating systems, AND some innovative and useful feotures of our own design.
DOSPIUS is now availoble for the TRS - 80"Model I, II, and III

## Moster Diskette Directory Ver 1.0-

This progrom will reod the directories of up to 160 diskettes or 5000 filesl linsert your diskette in the drive, press enter, and in works outomoticolly to reod, store, and cotegorize your files. No more looking through box ofter box of diskettes looking for those fovorite progroms thot are "Around Here Somewhers". You can get a listing of all the files on all the diskeltas. In oddition, you con list them by file estension, diskette number, or progrom cotegory. With moster directory, you need never agoin worry obout the frustrotion of not being able to locote a particulor progrom. Moster directory will seorch for a particulor file nome and give you every occurence of that file, its size, and the diskette number that contoins it.
A totally self contained, mochine longuage program on a self-booting dishette; moster directory will work equally well on single or multiple drive systems.

still on target, the port returns a value of 255 . If it doesn't, we return to the main program, having been unsuccessful in verify. ing the "hit."
To make absolutely certain the pen is on target, it is best to repeat this whole sequence once again, which is why the detection portion of the subroutine is nested in a "do twice" FORUNEXT loop. If the pen falls through the FOR/NEXT loop without having been returned to the main program, we can safely assume that the pen is on target.

To record positive verification, the pen status variable is set to one, the light pen is reset, and program control is returned to the main program. How the program proceeds after verification of the pen being on target is up to the programmer.
The final software consideration is to provide for situations where more than one target is presented to the user. This is accomplished in the main program with a FOR/NEXT loop which sequentially turns on each target and then checks the port address for triggering.
If the pen has been triggered, the program branches to the detection subroutine and determines if the pen is over the target currently being printed. Even though the pen may be placed on a target other than the one presently being polled, the FOR/NEXT loop quickly cycles
through all the target locations until the subroutine returns with positive verification of the pen at the current target position.

\section*{Two Programs}

To date, my experimentation with the light pen has resulted in two programs. The first is a short general history quiz which also instructs you in the use of the light pen. The second program is a challenging target game. None of the remarks are used for branching purposes in either program, so they may be deleted when you enter the program. If you leave them in the target game, they are a handicap as they slow down the program's execution substantially.

Apparently, other manufacturers besides 3G offer light pens that utilize the cassette port for polling and resetting. If you own one of these other pens, these two programs will run properly, if you change all I/O commands to OUT (255) and INP(255). The values returned from the port address on polling are undoubtedly 0 and 1 . These values should be substituted for the 127 and 128 values used in my programs.

For those of you without a light pen, Compututor History Quiz can easily be adapted for regular keyboard input. The questions are multiple choice.

\section*{The Game of Speedo}

The target in Speedo moves

\section*{UCSD* System for TRS-80 Model II \({ }^{+}\)}

The most portable operating system now supports FORTRAN. Pascal and/or FORTRAN modules are compiled in universal P-code, so they can run on most microprocessors, often without recompiling. Programs execute up to 10 times faster than comparable BASIC programs, and use much less memory. Ready to run on TRS-80 Model II ( 64 K ).

\section*{FEATURES}
- Interactive operating system-dynamic overlays, disk file handling, run-time support and block I/O routines.
- Fast, one pass compilers.
- Two Editors-one screen oriented for programming and text editing, one character oriented for hard copy terminals.
- File handler to manipulate disk files.
- Macro-assembler that produces code for linking with Pascal or Fortran programs.
- Linker for link-editing of object and assembly code modules.
- Library of program modules and utilities.

PLUS, from PCD Systems
- Disk formatting program to initialize diskettes in single or double density formats.
- Configuration program for serial I/O.
- Disk-set program to permit separate assignment of density and format characteristics for each disk drive.

\section*{DOCUMENTATION}
- UCSD System Manual (400 pages)
- Beginner's Guide To UCSD Pascal.
- Pascal User Manual \& Report.
- Fortran User's Manual with Fortran systems.

\section*{PRICES}
- UCSD System with Pascal Compiler \(\$ 350\) with Pascal and Fortran Compilers \(\$ 500\)
- Fortran Compiler alone (requires Version II.0) \(\$ 200\)
- P-Code Interpreter alone (either LSI-11 or Z-80) \(\$ 85\) Optional Utility Programs - CP/M \({ }^{2}\) to Pascal file conversion \$50 - TRSDOS \({ }^{+}\)to Pascal file conversion \(\$ 50\) - Z-80 Disassembler/Dump program \$ 50 ALSO AVAILABLE
- UCSD System for MINC or PDT
- Z-80 Adaptable System (you write BIOS). - UCSD System for CP/M environments.

PCD Systems is a licensed distributor of the UCSD System for Pascal and Fortran. Dealer

}
randomly within the confines of a graphics box. The object of the game is to "hit" it as many times as possible within the time limit. The game is comprised of five matches, each having a time limit of one hundred units. Watch out! You not only have to hit the target, but you have to remain there until the subroutine ensures that you are on target. Any time the pen is triggered and the subroutine finds that you are not on target, you will be penalized ten time units for your inaccuracy.

An interesting departure from the standard detection method
is given in lines 2820 and higher. Here time is used as the sole determining factor, since the pen need only be placed on a lit portion of the screen and held there for about five seconds. If the pen is still triggered after the timing loop in 2870 has been executed, the program clears all variables and restarts the game.

Through my experience, I have come to the conclusion that a light pen is probably the most valuable peripheral that you can add to your current system. It is possible to elim. inate all keyboard input except for RUN.

Program Listing 3. Computer History Quiz

\section*{Our new program package for the TRS-80" sounds terrific. So does the price.}

There are lots of programs with sound that are worth about a dollar. Trouble is, they cost a lot more.

But at Basics \& Beyond we've just developed Microcosm III, 20 programs with sound - each just as good as our competition's \(\$ 15\) and \(\$ 20\) pro-grams-for \(\$ 24.95\). That's a 20 -program package for \(\$ 24.95\).

It includes "Pinball," replete with ringing bonuses, spinners, buzzers and flippers; torpedofiring "Submarine" that explodes with underwater excitement; and the right/wrong buzzer in "Long Division" teaches step by step.

At Basics \& Beyond we underscored our point that most other program packages are overpriced with Microcosm I and Microcosm II, \$19.95 each. Now a lot of people will start hearing about our third package and stop listening to high prices.

You see, it's not that our program packages for the TRS \(-80^{7 \mathrm{M}}\) microcomputer are so cheap. It's just that theirs are so expensive.

\section*{BASICS \& BEYOND, INC.}

\section*{Apparat, Inc. introduces}

\section*{HOWDOS80}

\section*{For the 80's -}
an enhanced NEWDOS for your TRS-80 \({ }^{\text {w }}\) Model 1.

\section*{NEWUOS 80}

Apparat, Inc., announces the most powerful Disk Operating System for the TRS-80@. It has been designed for the sophisticated user and professional programmer who demands the ultimate in disk operating systems.

NEWDOS/80 is not meant to replace the present version of NEWDOS 2.1 which satisfies most users, but is a carefully planned upward enhancement, which significantly extends NEWDOS 2.1's capabilities. This new member to the Apparat NEWDOS' family is upward compatible with present NEWDOS 2.1 and is supplied on Diskette, complete with enhanced NEWDOS + utility programs and documentation. Some of the NEWDOS/80 teatures are:
- New BASIC commands that supports files with variable record lengths up to 4095 Bytes long.
- Mix or match disk drives. Supports any track count from 18 to 80 . Use

35,40 or 77 track \(5^{\prime \prime}\) mini disks drives or 8 " disk drives, or any combination.
- A security boot-up for BASIC or machine code application programs. User never sees "DOS READY" or
" \(>\) READY" and is unable to "BREAK", clear screen, or issue any direct BASIC statement including "LIST".
- New editing commands that allow program lines to be deleted from one location and moved to another or to allow the duplication of a program line with the deletion of the original.
- Enhanced and improved RENUMBER that allows relocation of subroutines.
- Powerful chaining commands.
- Print Spooler.
- DFG function; simultaneous striking of the D, F and G keys will allow the user to enter a mini-DOS to perform some DOS commands without disturbing the resident program. (e.g. dir while in scripsit.)
- Upward compatible with NEWDOS 2.1 and TRSDOS 2.3.
- Includes machine language Superzap/80 and all Apparat 2.1 utilities.
- Enter debug any time by pressing 123 keys. Also allows disk I/O.
- Diskette "Purge" command.
- Specifiable system options (limited sysgen type commands).
- Increased directory capacity.
- Copy by file commands.

NEWDOS \(/ 80\) with all of the
NEWDOS + utility programs, many of which have been enhanced, is priced at just \(\$ 149.00\) and is available at most
TRS-80 dealers.
As with 2.1, NEWDOS/80 relies on the TRSDOS and Disk Basic Reference Manual published by Radio Shack. NEWDOS/80 documentation supports its enhancements and upgrades only.

Announcing the most important utility ever introduced for the TRS-80* Model I and Model II-

\section*{ENHBAS"}

ENHBAS is an Enhanced Basic extension module, which loads at the top of BASIC, adding many commands and background tasks-
-Over 30 new commands added to your BASIC: -SORT-Multi-keying, multi-tagging array sort. Sorts thousands of items in mere seconds, all with one command!
-JNAME Sexp-Use line labels along with line numbers in branching statements, as in assembly language, using the ENHBAS commands GTO and CSUB (special GOTO and GOSUB). For example:
10 GTO "ENTER A LINE"
20 REM LINE 10 IS THE SAME AS 'GOTO 30' 30 JNAME "ENTER A LINE": INPUT AS
How many times have you wanted to use variables to reference line numbers? Now you can! GTO and CSUB allow variable expressions as operands, such as: GTO X+40 or CSUB (Y*10)+30.
-WHILE / WEND-New, structured programming loop construct. Makes for more logical program flow.
-EXEC / EVAL-Two new, extremely powerful functions! EVAL evaluates an algebraic expression in string form: \(\mathbf{A} \boldsymbol{s}={ }^{\prime \prime} \mathbf{X}+\mathbf{2 "}^{\prime \prime}: \mathbf{Y}=\mathbf{E V A L} \mathbf{A} \boldsymbol{S}\) would result in \(\mathbf{Y}\) being set equal to the algebraic expression \(\mathrm{X}+2\). With EVAL, you can manipulate complex functions in string form, and then execute them.
EXEC executes a string expression as if it were a BASIC program line! For example:
A \(\mathbf{S}=\) "PRINT X" : X \(=4\) : EXEC AS would result in a 4 printed on the screen (that is, execution of the BASIC statement "PRINT X"). With EXEC, your computer can write its own programs and execute them!
-CALL-Pass control to machine language sub-routines at any address, passing parameters both ways.
-CLM / PAGE-Set up automatic page roll-over and other line printer functions from BASIC.
\(\bullet\) All these and many more!
DIn addition to the above commands, Model I ENHBAS contains vector graphics and drawing commands. Model II ENHBAS has many functions suited to business programming-ISAM file handling commands, RS-232 access, and many more; along with several Model I BASIC commands left out of Model II (PEEK, POKE, etc.).
DENHBAS includes many background utilities:
- User-select cursor

\section*{-Key click}
-2-tone beep on error -Automatic lower-case \(\bullet\) Automatic debounce
ENHBAS is available for:
16K Model I-Level.II Tape
\(\$ 39.95\)
32K Model I Disk
\(\$ 39.95\)
32K Model II
\(\$ 99.95\)

\section*{Other software:}

CSG PILOT-Disk-based, high level language. Fast!
32K Model I Disk.
-Short-entry commands (Shift-letter)
- Real Control keys
-One-letter commands
-Formatted LISTing
\$59.95

\section*{A Proven CP/M Screen Oriented Editor For TRS-80 I \& II}

\section*{You Customize the Fastest Editor for Word Processing, C-Basic, Fortran and Assembler.}

\section*{Features of VEDIT:}

Full screen editor with status line. The screen continuously displays the region of the file being edited. Changes are made by moving the cursor to any place in the file and typing in new text or hitting a function key. You easily edit 10 times faster than with a command editor.

Full array of cursor movements with single key movement to begin and end of lines and to tab positions.

Function keys for character delete, line delete and allowing line splitting and concatenating.

Text movement is very easy using a text register.
Flexible command mode allows global search and substitute, repetitive editing operations.

Blocks of text are readily copied from one file to another. Files may be merged on input, split on output and more.

Extensive 60 page, clearly written manual with sections for both the beginning and experienced user.

\section*{Special Features:}

Disk buffering can automatically perform Read/Write for files larger than available main memory.

Tabs settable to any positions. Tab key inserts tab character or spaces to next tab position.

Display of clearly marked continuation lines for text lines longer than the screen.
You Customize It:

Keyboard layout for cursor and function keys.
Default Tab positions and various parameters.
Scrolling methods.

\section*{Changes You Make On the Screen Become Changes to the File.}

Compare with the other screen oriented editors, and note that VEDT:

\section*{- Creates and edits standard text files, Needs no conversion program. \\ - Requires no hardware changes. \\ - Never looses characters during fast typing.}

Ordering: Currently for \(C P / M\) only, specify \(C P / M\) vendor. Also available for most other CP/M systems.

\title{
DEBUG-S/S \\ FOR YOUR TRS-80*
}

\section*{AT LASTII A POWERFUL DEBUG MONITOR FOR THE EXPERT \& NOVICE PROGRAMMERS}

DEBUG-S/S is a uniquely powerful monitor for: [1] analyzing. (2] creating or modifying, and \([3]\) debugging machine-language programs on your level ii, 16K system.

\section*{EFFICIENT - SIMPLE - FUN}

No longer do you need to keep reaching for your reference card or searching through your program listing while debugging your program. - Most all of this information is at your fingertips with DEBUG-S/S. Warning - Debugging your program with DEBUG-S/S is so efficient and convenient that you may find yourself wishing that you had more bugs to find

RUN IN SLOW MOTION
With DEBUG-S/S you may run your program in slow motion or single step and observe your \(2-80^{*}\) registers dynamically and/or observe your message printing on the screen one-character-at-a-time

SPLIT/SCREEN DISPLAY
DEBUG-S/S uses a convenient split screen display system. The upper right section of the screen automatically displays upon entry to DEBUG-S/S from the user's program. This section shows the user's next instruction in hexadecimal and disassembled symbolic form, and also shows the user's major \(2-80^{\circ}\) registers. The left portion of the screen is for the user's display or a scratch pad area for memory dumps. The lower right section of the screen is where DEBUG-S/S commands are entered and echoed for the user's inputs.

\section*{TRANSPARENT MODE}

DEBUG-S/S may be operated in a transparent mode which leaves the entire screen showing all of the user's display data upon entry to DEBUG-S/S. except for the letter 0 displayed on the upper right corner of the screen indicating that DEBUG-S/S has been entered. If the user now wishes to examine his \(2-80^{*}\) registers, he simply types D (Display).

\section*{"NO CRASH" BREAKPOINTS}

DEBUG-S/S uses a single byte breakpoint which means you may put a breakpoint in the first byte of any instruction in your program and not cause your program to crash because of the breakpoint insertion. Your breakpoint will stay active until you reset it or redefine it. This allows you to run through loops in your program repeatedly without having to redefine your breakpoint each time. You may enter any number of one byte pseudo breakpoints simultaneously in your program manually with the Memory command

POWERFUL COMMANDS
Examples of DEBUG-S/S commands are: Jump - Go - Breakpoint Memory examine/modify - Hex Dump - ASCII Dump - Symbolic instruction Dump - Single Step - Automatic Step start/stop - Increase/ Decrease Auto Step rate - Clear Screen and save cursor position - Clear Screen and home cursor position, plus other commands.

YOU WILL RECEIVE
You will receive a cassette and instruction manual. DEBUG-S/S is assembled into lower memory on one side of the cassette and into the top of 16K memory on the other side. DEBUG-S/S uses 4K of RAM.

\title{
Learn to use the RST instruction call to greatest advantage NOW!
}

Roger L. Pape
7545 Marble Dr. Liverpool, NY 13088

Anyone who has attempted to trace the program flow of the system software in the Radio Shack TRS-80 has probably encountered the RST (restart) instruction.

Some calls are used by the system to invoke frequently used utility routines. Details of these routines are provided so that a user might take advantage of the system software to reduce the coding required in application programs.

\section*{The RST Instruction}

In the Z-80 instruction set the

RST provides a compact (one byte) subroutine call. Its major advantage is a savings of two bytes over the normal CALL nnnn instruction. While the RST was intended to service interrupts, it can also be used for frequently called utility routines in the system software in order to save as much memory space as possible.

Unfortunately, its format limits RST's flexibility. A description of the RST instruction, as described in the vendor literature, is shown in Table 1.
(Note that the Z-80 assembly language convention uses the actual address for the operand, whereas 8080 code uses operands ranging from 0 to 7.)

Upon execution, a call is made to one of eight fixed memory locations (three "address" bits in instruction). These implied addresses are only eight bytes apart, allowing little room for any code of substance. Therefore, the usual practice is simply to put jump instructions, which transfer to an area where more space is available, at these

\section*{Get Serious}
locations.
The restart addresses are at page zero, the lowest memory addresses. In the TRS-80 this area is read-only memory (ROM) and cannot be modified by the user. To avoid being locked into specific addresses, the RST jumps twice, first from the page zero ROM area to an area in writeable RAM memory, which can be modified.
These standard locations in RAM (referred to as the restart vector table) are defined by the jump instructions burned into ROM and, in turn, contain jump instructions to the area where the actual service routine resides. Because of these extra jumps, it is obvious that the RST instruction has no speed advantage over the CALL instruction. As stated earlier, the RST is used in the Level II software to save memory space.

\section*{Using RST with Level II}

The default locations for RST 08 H through RST 38 H routines are defined at system initialization (power-up), when jump instructions are loaded into RAM
location 4000 H to 4014 H . The addresses loaded in this area can be modified after power-up to change any of the RST routines, except the power-up routine (RST 0). Note, however, that the TRS-80 Level II software makes use of six of the eight available RST calls. The user should not modify any of those six vectors, with the possible exception of the last one, RST 38 H .

Table 2 shows the sequence of addresses in hexadecimal called by the various RST instructions and the actual ser-

vice routine that is finally executed. These are the defaults initialized by the Level II software.

The following sections discuss each of these routines in more detail. If one wishes to use them in his own programs, the inputs expected and the outputs returned are described. In several cases, the A register is used within the routine and modified. If the contents of this register prior to the RST call must be preserved, either store it away (e.g. push it on the stack) or, if possible load the value into another register that is not affected.

\section*{RST \(\mathbf{O}\) ( \(\mathbf{( O O H}\) )}

This routine is invoked when the system is powered up, generating a hardware reset and Initializing the program counter to 0000. A software call of RST 00 H results in the same restart.

Basically, the initialization proceeds as follows. Interrupts are disabled and the cassette output port is cleared. The default RST vectors and device control blocks are copled from ROM into the lowest RAM locations, starting at 4000 H . The system then checks to see whether to continue the initialization from ROM or from disk.

If a disk controller is present in the system and the break key is not depressed, it tries to copy a one-page bootstrap routine from disk. Note that because the disk controller is in the expansion interface, the break key must be depressed, to prevent the system from dropping into the disk initialization when the interface, but no disk, is present. Otherwise, the initiallzation con-

ELECTRONICS MART, LTD.
tinues from the Level II ROM software, copying additional default values from ROM to RAM, setting various memory pointers and beginning the MEMORY SIZE? dialog.

\section*{RST 1 (08H)}

The RST 08H call checks whether the last character read from an input string is a specific
character required by the syntax of the statement being processed. If the proper character is found, the routine continues to the next character in the same manner as the RST 10 H call (see below); otherwise a syntax error return is used. The character to be checked must be stored in the next byte after this instruction.

Inputs: HL register pair points
to character to be checked (requires character immediately after instruction).
Outputsa) If proper character, A contains next character not a space, HT, or LF HL points to location of character returned.
Flags: \(\quad\) Carry flag set if digit ( 0 to 9 ), else cleared; zero flag set if colon (:). else cleared.
b) If wrong character, jumps to SN error return

Other registers modified: If error return, A,B,C,E.
Table 3.

Inputs: HL points one location prior to next character to check.
Outputs: A contains next character, not a space, HT, or LF. HL points to location of character returned. Flags: Carry flag set if digit (0 to 9), else cleared; zero flag set if colon (:), else cleared. Other registers modified: None.

Table 4.

\section*{FASTER THAN A SPEEDING TYPIST...}

Is it safe to walk the keyboard of your TRS-80 at night? Do you look for Syntax Errors down every dark subroutine? Well, look in your mailbox-It's a bill, it's an ad, it's CLOAD MAN! Faster than keying in hardcopy, more fun than an accounts-receivable package, ready to run in a single load ...

When mild mannered Clyde Cload (star cassette tape duplicator at the MONTHLY CLOAD) dons his cape, the evil Typo-Bugs cringe in terror. This mighty Man of Iron Oxide swoops down on your TRS 80 by First Class Mail every month with super, ready-to-load programs for your (and your computer's) education and enjoyment.

Join in the battle against the Finger-Cramps, Edit Modes, and Typo-Bugs. Let CLOAD MAN come to your computer's aid by getting a subscription to CLOAD MAGAZINE.

\section*{Q: When you're past the fundamentals, what's next? \\ A: Plenty.}

Learning the ins and outs, ups and downs, and all the different capabilities of our TRS-80 can really be a lot of fun. But sometimes it's not very easy. When you're stumped, who do you turn to? Maybe a local friend, perhaps your users group. Another important source of information and knowledge is magazines. We at The Alternate Source know several knowledgeable persons who are willing to share their store of information, in the form of tutorials, commentaries, demonstration programs, tips, techniques and more. Among our regular authors are the very-well respected Dennis Bathory Kitsz, the extremely knowledgeable Allan Moluf, the wise and witty Jesse Bob Overholt, and the master tutorialist Bill Brown. You'll meet others, too, who all have good ideas to share.
So when you're past the fundamentals, that's when the fun really begins. And The Alternate Source is right there. keeping you up to date on all the latest information. Published bi-monthly, six issues are just \(\mathbf{\$ 9 . 0 0}\). Or yon can sample an issue for only \(\mathbf{\$ 2 . 0 0}\). Put The Alternate Source on trial, and see if it isn't worth every hardearned penny vou pay for it! Satisfaction guaranteed or your subscription can be cancelled at any time. A limuted number of sme back issues are arailable.

\section*{Meta-Trek}

This is NOT your average star-trek game! Meta-Trek requires 32 K and one disk drive, and features several never-before-incorporated missions! You'll be dodging black holes and meteor storms, contemplating time warps and dealing with sensor-zapped quadrants! You'll have the help of your computer (which resembles a TRS-80 remarkably) and a detailed report on your standings, but this one still isn't easy! There is a FREEZE command, though, to allow you to save your progress to disk. An execellent plot, with execellent graphics to match! Fast, too, with embedded Z-80 routines. This one's \(\$ 19.95\) and comes on diskette with an orientation manual...well worth it! We've already enjoyed hours and hours, and have many more to go!

\section*{TRAKCESS}

TRAKCESS will probably be the most valuable utility you'll ever own! Why? Just look at the functions it will perform:

Will allow you to back up those protected diskettes so you don't have to use the original!
Will allow you to recover damaged diskettes; read, write, edit or create ANY track or sector, standard or not!
Will allow you to utilize a super 'Electric Pencil' type of editing!
Will allow you to gain access to previously unaccessible information embedded in diskettes!
Will bring under direct control every capability of the TRS-80's 1771 Floppy Disk Controller!
TRAKCESS requires 48 K and two drives are desirable for most functions. Price is \(\mathbf{\$ 2 4 . 9 5}\) but to make it even more affordable, you can add up to five cents for each copy you wish to make (up to five) and sell to your friends. This allows us to save on shipping, packaging, diskettes and labor, so we'll pass the savings on to you! Appreciate it? Make it a success!

As an example of the use of this routine, suppose the text just processed must be followed by a comma and then some additional data. The code would be:

> RST 10 H
> DEFB:

Note that the RST routine automatically increments the return address past the defined character.

\section*{RST 2 (10H)}

This service routine is used primarily for scanning input character strings. It retrieves the next non-blank character after the current HL pointer location, also skipping over any horizontal tab (HT) and line feed (LF) characters that may be in the string.

In addition to returning the character and its memory location, it also sets or clears certain condition flags to indicate the type of character retrieved. The RST 10 H call is usually followed by a conditional jump, depending on the type of character expected next. (Table 4).
Be sure to note that the HL register pair is incremented before the character is read. As an example of its use, a routine may be converting digits in the input string to an integer value. The process would be terminated if a non-digit character is encountered. Then the coding would include:
\[
\begin{aligned}
& \text { RST } 10 \mathrm{H} \\
& \text { RET NC }
\end{aligned}
\]
(process character in A)
compares the contents of the HL register pair to the contents of the DE register pair. It performs an HL - DE compare and sets the appropriate condition flags.

The routine is particularly useful when comparing a memory pointer to some memory limit or other stored pointer. When comparing memory addresses, the carry flag should be tested rather than the sign flag.

An address greater than 32 K is considered higher than one below it, but the sign bit is set (negative) for these upper addresses. Comparisons across the 32 K boundary could cause erroneous results if the sign flag is used.

On the other hand, if the RST call is used for a true arithmetic comparison, use the sign bit instead. In the latter case, the sign bit must be exclusive ORed with the overflow flag in case the difference exceeds the 16 bit number range. (Table 5).

For example, to generate a jump if the HL pointer is higher than or the same as the DE pointer, the code would be:

> RST 18 H
> JP NC, \(n n n n\)

\section*{RST 4 (20H)}

This service routine is used in the Level II software to check the type of the variable that is currently being processed. The
variable type indicator (corresponding to byte length) is stored in location 40AFH of the reserved area in RAM. (Table 6).

The routine tests the type indicator in such a way that one of the four condition flags used has a unique setting for each of the types. (Table 7).

A RST 20 H call is followed by a conditional jump instruction. For example, to branch if the variable is single precision, the code would be:

> RST 20H JP PO,nnnn

\section*{RST 5 (28H)}

Not used by Level II BASIC; therefore, the default is an immediate return. This RST is executed in the Level II keyboard driver when the break key is depressed. Modifying the restart vector ( 400 C -E) allows one to intercept execution when the break key is pressed.

\section*{RST 6 (30H)}

Not used by Level II BASIC: therefore, the default is an immediate return.

\section*{RST 7 (38H)}

The default coding for this RST simply reenables interrupts and returns. One should be aware that this RST is somewhat special.

First of all, the machine code
for this instruction is FFH, a value to which much of memory initializes. An inadvertent jump to one of those locations will invoke the restart.

Secondly, if the Z-80 processor is set in interrupt Mode 1 by the IM1 instruction, a nonmaskable interrupt (the kind generated by pushing the reset button behind the keyboard) executes a restart to location 38 H instead of the normal NMI restart to location 66 H when in Mode 0 (the power-up default). Setting interrupt Mode 1 and loading a jump instruction at locations \(4012-4 \mathrm{H}\) allows one to intercept execution after the reset button is pushed, rather than enter the reinitialization routine in ROM.

\section*{Conclusion}

The service routines called by the RST instruction in the TRS-80 Level II software were chosen because they are frequently used functions. It is to the advantage of any serious assembly language programmer to understand these routines and try to use them.

For example, a program which reads in and scans lines of text might be written to utilize the RST 10 H call effectively. The programmer who is interested in the ultimate compactness might also consider using those RST's not claimed by the system software.

For DOS users, be sure to first check how your operating system uses them.

Inputs: (40AFH) = variable type
Outputs: Flags-Sign flag set only if integer, else cleared; zero flag set only if string, else cleared;
PN flag cleared (PO) only if single prec, else set (PE)
Carry flag cleared only if double precision, else set
Other registers modified: A (contains type indicator -3.)

The function of this routine

\title{
PMC-80 Level II 16K at \$645
}

\section*{SOFTWARE COMPATIBLE}
- Reads all Level II BASIC tapes
- Reads all SYSTEM tapes
- Full range of peripherals
- Video output for monitor and TV
- Optional FASTLOAD at 8000 band
- Optional Upper/Lower case

The PMC-80 is a "work-alike" computer to the popular TRS-80* Model I, Level II by Tandy, Radio Shack. The PMC-80 has 16 K bytes of RAM and the complete Level II 12K BASIC ROM by Microsoft that makes it \(100 \%\) software compatible with programs from Radio Shack and from the hundreds of other independent suppliers. The built-in cassette player reads standard Radio Shack programs for the TRS-80:

Sold through computer stores.

The PMC-80 will operate with any of the many peripherals Radio Shack and other independent vendors have invented to plug into the TRS-80: Most importantly, the Interface Adapter permits Expansion Interfaces with memory expansion to 48 K to be added. An Expansion Interface will also permit the addition of Radio Shack compatible \(5^{1 / 4}{ }^{\prime \prime}\) disks and disk operating systems, RS 232, printers, etc.
'TRS-80 is a registered trademark of Tandy Radio Shack.

\section*{More on this handy speed-up device for the Shack's Level II BASIC.}

\title{
The Useful USR(0) Function
}

\section*{Terry Kepner}

PO Box 481
Peterborough, NH 03458

As I slowly worked my way into assembly language programming, I discovered the usefulness of the Radio Shack USR(0) function. To those of you who have not yet tripped across this utility, USR( 0 ) allows
you to call assembly language routines from BASIC programs. This is handy when you want to speed up the normally tedious graphic functions and string manipulations of Level II BASIC.

There are two primary methods used to imbed these routines into your program. The first method is the easiest for a programmer to use, but can lead
to problems for the end user. It involves loading the assembly language routine into memory via the System command, and then using CLOAD for the BASIC part of the program.

\section*{Second Method}

The second method takes advantage of POKE and lets you load the assembly language
routine as a part of the BASIC program itself. To do this you place the assembly language instructions in data statements, then POKE these statements into active memory.

Since the first method requires loading two different programs, user errors may creep into the programs. The second method eliminates this problem,

by Rick Sothen, John Laurence, Walter Gavenda

\section*{BEAT THE SPREAD!}

Relax and enjoy the game--you already know the winner. You even have a predicted point spread. You know what's happening in all the other games, too.
BASKETBALL, first in the ELECTRONIC HANDICAPPER series, will introduce you to the benefits of predicting in advance the winners of this season's basketball games. This two-tape package gives you power ratings to get you started. You keep the data tape informed of the current week's wins, losses and points with about an hour of your input time each week. The program then calculates a winner and point spread for you to use.
Last season, our test market was able to predict \(85 \%\) of the winners with a point spread accuracy of \(64 \%\). One week, five upsets were accurately predicted.
Now, Acorn doesn't guarantee any specific percentage of accuracy, and we certainly don't want to encourage anyone to develop any bad habits. ELECTRONIC HANDICAPPER: BASKETBALL is designed to enable you to pick winners and predict point spread with a degree of accuracy which significantly exceeds the laws of chance.
The two-tape package is \(\$ 99.00\) and requires Level II 16 K TRS-80.* You can put it on disk if your system is disk based.

We're betting that you'll enjoy this and other fine Programs such as CHECKBOOK PLUS (\$29.95) and SUPERSCRIPT ( \(\$ 29.95\) each) from Acorn Software Products. Ask for these and other quality Acorn programs at your local computer store.

Character Codes Decimal \& Hexadecimal
but introduces its own: conversion.

BASIC uses decimal numbers when POKEing and assembly language uses hexadecimal numbers for its instructions.

This means that the program. mer must convert the hexadecimal numbers into decimal in order to use the POKE process. This is a painful and boring procedure. There is also a good possibility that the programmer will make an error.

It didn't take me long - three Opcodes - to realize that doing it that way was for the birds.
So, I wrote a short program that did this chore for me and also produced a hard copy for future use.

Since I have found this hard copy indispensable, l've decided to share it with the rest of
computerdom. The rest of this article is the Z.80 Opcode Hexadecimal-to-Decimal Conversion Chart. Also included is a hex-decimal listing of the ASCII codes, including both upper and lowercase characters. (The new Radio Shack manual leaves out the lowercase letters.)

I hope you find this chart to be as useful as I find it.

DISK DRIVE WOES? PRINTER INTERACTION? MEMORY LOSS? ERRATIC OPERATION? DON'T BLAME THE SOFTWARE!

ISO-1

Power Line Spikes, Surges \& Hash could be the culprit! Floppies, printers, memory \& processor often interact! Our unique ISOLATORS eliminate equipment interaction AND curb damaging Power Line Spikes, Surges and Hash. -ISOLATOR (ISO-1 A) 3 filter isolated 3-prong sockets; in tegral Surge/Spike Suppression; 1875 W Maximum Ioad, 1 KW load any socket
\(\$ 56.95\)
-ISOLATOR (ISO-2) 2 filter isolated 3-prong socket banks; ( 6 sockets total); integral Spike/Surge Suppression;
1875 W Max load, 1 KW either bank . . . . . . . \(\$ 56.95\)
-SUPER ISOLATOR (ISO-3), similar to ISO-1A
except double filtering \& Suppression . . . . \(\$ 85.95\)
\({ }^{\bullet}\) ISOLATOR (ISO-4), similar to ISO-1A except
unit has 6 individually filtered sockets . . . . \(\$ 96.95\)
*ISOLATOR (ISO-5), similar to ISO-2 except
unit has 3 socket banks, 9 sockets total
\(\$ 79.95\)
\({ }^{\bullet}\) CIRCUIT BREAKER, any model (add-CB) Add \(\$ 7.00\)
-CKT BRKR/SWITCH/PILOT any model
(-CBS) . . . . . . . . . . . . . . . . . Add \(\$ 14.00\)

\section*{ADVANCED BUSINESS SOFTWARE FOR THE TRS-80}

\section*{(Now Available For Model II Also)}
- FORECASTING - RISK AMALYSIS - U.S. MACRO MODEL If you're serious about improving your business with a computer, why not use the best business planning software available? Dr. David M. Chereb has made the most powertul and successful business analytical techniques available to micro computer users.
All programs listed below are in Basic, for \(\mathbf{3 2 K}\) (or more) disk based TRS-80 systems.

BUSIMESS PLANNING PACKAGE for FORECASTING. An integrated set of forecasting programs to handle a variety of business forecasting needs from Trend Analysis to Advanced Multiple Regression ( 100 pg . User Manual) \(\$ 99\).
INVESTMENT RISK AMALYSIS . The major ingredient in any investment is uncertainty. This program accounts for cost changes, shifting revenue streams and interest rate fluctuations. Now you can manage risk. \((35 \mathrm{pg}\). User Manual) \(\$ 99\).
U.S. SIMULATION MODEL - Knowing where the economy is going and how it reacts to government fiscal and monetary actions can save you a lot of money. This is a user oriented economic situation model constructed to professional standards (50 pg. User Manual) \(\$ 199\).

\section*{MOTICE TO CUSTOMERS:}

Because of the tremendous increase in recent orders. our shipping response time has slowed. We are expanding in order to correct this situation. But for the next month our shipping date will average one week after receipt of your order.
To order CALL 213/424-3652, or write to APPLIED ECONOMIC ANALYSIS, 4005 Locust Ave., Long Beach, CA 90807.

\section*{This Weekend: STIK \\  -.to your}

That's right! Esmark's VIDIET-STIK light pen has the TRS-80 CONNECTION for LEVEL 18 II. Your 4 K to 48K TRS-80 System will come alive under your VIDIET-STIK within minutes of its arrival. That's because there are no wires to solder or traces to cut. You're up and running as fast as you can plug the interface into your system's cassette EAR-jack. CLOAD our custom LIGHTplug for your recorder, you won't have to unplug it again when loading your other software tapes. The interface allows them to pass right thru whenever you're not using the pen. it's exclusive "switched tip" design means the pen's electrically isolated from your system when it's not in use. Just point \& press' it's that simple. Plug. CLOAD and RUN. And have we got the software for you to RUN with' Our demonstration tape includes a calibration program (used to adjust the CRT's brightness and contrast) plus STIK-TAC-TOE, AWARI and TOWERS. Two challanging games and a puzzle that will keep grownups and children Stik'ing it to your T'RS-80 for hours. And there are instructions provided so you can begin writing your own light pen programs (lightware) for fun or profit (Level II). Or, just sit back and enjoy our LIGHT-WAVE tapes each month. Esmark's unmatched commitment to lightware can bring you up to five new games, puzzies, drilis \& educational quizes or simulations each month. Our current LIGHT-WAVE releases are

LIGHT-PAK 2 - LIGHTPEG (4 peg-jump puzzies)
ENDRUN (Othelio with a 'twist')
Price \(\$ 19.95\) (including postage 8 handing
LIGHT-PAK 3 - LITEGAMMON (Backgammon you'll Stik with)
(LEVEL II) STIKWUMPUS (Caves with a little lite')
MAZEMASTER (Maze after maze to poke thru)
PRICE \(\$ 19.95\) (including postage \& handling)

Order yours now and we'll include a tree copy of FLASHBACK. Esmark's newsletter dedicated to the latest news in lightware applications. And. don't forget to tell your friends. The VIDIET-STIK can also be ordered for use on most other micro systems using the following processor chips
\(8080 \quad \mathbf{Z 8 0} \quad 6800 \quad 6502\)

All that's required is a standard cassette jack leading to Ground and a instructions for writing lightware applications. And tell your local Dealer that Esmark's got a Deaier package he won't want to miss out on. Delivery is 3 to 6 weeks from receipt of your order. C.O.D s are \(\$ 3.00\) extra but will be shipped within two weeks. All prices are F O.B. Mishawake, Indiana. Indiana residents add 4\% state sales tax

\section*{ALSO COMING FROM ESMARK:}
[ ] TRS-80 Printer Interface (Cassette AUX-jack interface for all RS232 printers Includes LLIST\& LPRINT software)

1 TRS-80 RS232 Communications Interface (Makes your TRS-80 a full I/O terminal to timesharing systems the world over. Gives you intelligent or dumb terminal capabilities at 110 or 300 BAUD Álso includes Printer Interface above with 20 mA current loop \& TTL level I/O options.)
- TRS-80 is a trademark of the Tandy Corporation -

Livestock farmers are now using large computer systems to store and process data on individual animals and herds. Regional interactive computers can be accessed over telephone lines for individual animal feeding recommendations. Dairy and goat farmers can enroll in the Dairy Herd Improvement Association (DHIA) to get monthly reports on milk production, as well as maintain permanent cow histories.

Dairy researchers have developed a herd reproductive management concept for which a microcomputer is ideal. A computer program can forecast a sequence of caretaker activities for breeding cows. The program can recommend whether or not to breed and which bull to use; it can schedule vaccinations and medical exams, and describe treatment for different health problems.

\section*{Computer Tasks}

Four questions need answering when developing a breeding and health management system.

First, what management reports are needed? You can include a number of useful reports, including the following:
1. Calvings expected within the next \(X\) days.
2. Uterus exam needed because of recent calving.
3. No heats reported \(X\) days or more since calving.
4. Heats to be expected today.
5. Not pregnant for \(X\) days or more.
6. Pregnancy check needed today.
7. Dry off within the next \(X\) days.
8. Reproductive tract problems within the last \(X\) days.
9. Health treatments (not reproductive) made within the last X days.
10. Antibiotic treatments made within the last \(X\) days.
11. Vaccinations needed today.

Second, what information must be stored to get those reports? Several items must be filed regularly to insure timely and complete reports. The input options include:
1. Add a new animal to the disk.
2. Calving information.
3. Results of uterus exam.
4. Heats seen, receive bull to use.
5. Whether or not to breed and which bull to use.
6. Inseminations completed.
7. Results of pregnancy exam.
8. Cows dried off.
9. Reproductive health problems and treatments made.
10. Health (not reproductive) problems and treatments made.
11. Vaccinations completed.
12. Delete an animal from the disk.

Dairy managers may want to know everything about an animal or a subject.

The suggested information groupings are as follows:
13. Animal location, status, sex.
14. Vaccinations.
15. Calvings.
16. Pregnancy status, heats and breedings since last calving.
17. Reproductive health items.
18. Health (not reproductive) items.

Third, how will each record be packed? This project uses version 2.2 of TRSDOS, which
packs each buffer (and hence each 256-byte disk record space) according to this format:

1 byte = alphanumeric (string) character.
\[
2 \text { bytes }=\text { integer }
\]

4 bytes \(=\) single-precision number.

8 bytes = double-precision number.

To store as much as possible, devise a set of codes to represent alphabetic information. Although string characters might seem to be the most effective, the possible code list is short. It includes 0 through 9 , the alphabet and a few other symbolswell under 100 codes. Integers use two bytes but the possible codes range from \(-32,768\) to +32,767; over 65,000 definitions can be set. Floating point numbers can be stored directly as data or can be treated as codes.

Fourth, will code numbers or alphanumeric data be stored?
A dairy farmer who knows cows by name should get to know them by number. If he has a choice between identifying a cow as Penelope or 9998, the trade-off is clear. 9998 requires two bytes; Penelope needs eight. Integers use less disk space, and most farmers al-

The Electric Pencil is a Character Oriented Word Processing System. This means that text is entered as a continuous string of characters and is manipulated as such. This allows the user enormous freedom and ease in the movement and handling of text. Since lines are not delineated, any number of characters, words, lines or paragraphs may be inserted or deleted anywhere in the text. The entirety of the text shifts and opens up or closes as needed in full view of the user. Carriage returns as well as word hyphenation are not required since each line of text is formatted automatically.

As text is typed and the end of a screen line is reached, a partially completed word is shifted to the beginning of the following line. Whenever text is inserted or deleted, existing text is pushed down or pulled up in a wrap around fashion. Everything appears on the video display screen as it occurs thereby eliminating any guesswork. Text may be reviewed at will by variable speed or page-at-a-time scrolling both in the forward and reverse directions. By using the search or the search and replace function, any string of characters may be located and/or replaced with any other string of characters as desired. Specific sets of characters within encoded strings may also be located.

When text is printed, The Electric Pencil automatically inserts carriage returns where they are needed. Numerous combinations of Line Length, Page Length, Character Spacing, Line Spacing and Page Spacing allow for any form to be handled. Right justification gives right-hand margins that are even. Pages may be numbered as well as titled.

\section*{the electric pencil \\ -a Proven Word Processing System}

The TRSDOS versions of The Electric Pencil II are our best ever! You can now type as fast as you like without losing any characters. New TRSDOS features include word left, word right, word delete, bottom of page numbering as well as extended cursor controls for greater user flexibility. BASIC files may also be written and simply edited without additional software.

Our CP/M versions are the same as we have been distributing for several years and allow the CP/M user to edit CP/M files with the addition of our CONVERT utility for an additional \(\$ 35.00\). CONVERT is not required if only quick and easy word processing is required. A keyboard buffer permits fast typing without character loss.
\begin{tabular}{lcc} 
& CP/M & TRSDOS \\
Serial Diablo, NEC, Qume \(\$ 300.00\) & \(\$ 350.00\) \\
All other printers \(\ldots .\). \$ 275.00 & \(\$ 325.00\)
\end{tabular}

The Electric Pencil I is still available for TRS-80 Model I users. Although not as sophisticated as Electric Pencil II, it is still an extremely easy to use and powerful word processing system. The software has been designed to be used with both Level I (16K system) and Level II models of the TRS-80. Two versions, one for use with cassette, and one for use with disk, are available on cassette. The TRS-80 disk version is easily transferred to disk and is fully interactive with the READ, WRITE, DIR, and KILL routines of TRSDOS.

Disk \$
150.00

\section*{Features}

TRSDOS or CP/M Compatible * Supports Four Disk Drives * Dynamic Print Formatting * Diablo, NEC \& Qume Print Packages * Multi-Column Printing * Print Value Chaining * Page-at-a-time Scrolling * Bidirectional Multispeed Scrolling * Subsystem with Print Value Scoreboard * Automatic Word \& Record Number Tally * Global Search \& Replace * Full Margin Control * End of Page Control * Non Printing Text Commenting * Line \& Paragraph Indentation * Centering * Underlining * Boldface

ready accept code numbers. Integers ease the task of writing software because they can be used directly as array indexes. A suggested set of descriptions with codes and variables for herd use is in Table 4.

\section*{Dairy Cow Files}

The following file formats will meet your reporting needs and will work as random access files within the constraints of the TRSDOS. I offer the formats, records and variables as a starting point for your own project.

Discuss them with farmers, ranchers, animal scientists, veterinarians and other livestock professionals. The final decisions are too important to be left only to systems analysts and programmers!

I set up three random access records of data for each cow. On TRSDOS diskettes 335 records are available. Keeping all three records for a cow on one disk, 100 cows use 300 records. This leaves 35 records for other uses.

I use records 305 and 310 as indexes to keep track of which cow identification numbers are at which record locations.

In accessing the disk, the computer first gets record 310 and finds the cow's record num-
ber. If the cow is not on the disk, an appropriate message is printed. If the cow is on the disk, the variable JCOW is set equal to the cow's record number. The first record carrying status, calvings and breeding can be put or retrieved at JCOW, the second at JCOW + 100 and the third at JCOW + 200.

Tables 1, 2 and 3 give the detailed descriptions of space utilization, buffer variables and random access memory variables for records 1, 2 and 3, respectively.

Although each record can have \(\mathbf{2 5 6}\) bytes, none of the sug. gested formats use it all. Some space is left for future data additions. Also, the machine will run better if it isn't filled to capacity.

To store RAM variables on a disk, you must reset the RAM variables into fielded buffer variables and put the buffer variables onto the disk. To get data from a disk, the computer takes one record and places it in a fielded buffer. The buffer values are then reset into RAM variables for manipulation. Several buffers may be activated simultaneously, thus making several records of data available.

Each record starts with the cow identification number and a

DIVISION OF MARK GORDON ASSOCIATES, INC. 15 KENWOOD ST., CAMBRIDGE, MASSACHUSETTS 02139

\section*{SORT-80}

\section*{Produced exclusively for} Mark Gordon Computers by SBSG

TRS-80* disk files may be sorted and merged using SORT-80, the general purpose, machine language, sort program. Written in assembly language for the Z-80 microprocessor, it can:
-Sort files one disk in length
-Sort Direct Access, Sequential Access and Basic Sequential Access files
-Reblock and print records
-Recontrol files from disk
-Be executed from DOS
-Be inserted in the job stream
- Allow parameter specification - input/output file specification
- input/output record size
- lower/upper record limit - print contents of output file - input/output file key specifiers

The minimum requirement is a 32 K TRS-80* Level II computer with one disk drive or a single drive Model II computer. It will operate on 35, 40 and 77 track drives, and has been tested on TRSDOS 2,1, 2.2, 2.3, NEWDOS 2.1, 3.0 and VTOS 3.0.1. It is compatible with most machine language printer drivers. Sort time is fast: for example, a 32 K file will sort in approximately 40 seconds. \(\$ 59\).
InfoBox is the easiest-to-use information manager available for the TRS-80*. It's ideal for keeping track of notes to yourself, phone numbers, birthdays, inventories, bibliographies, computer programs, music tapes, and much more. This fast assembly language program lets you enter free-format data, variable length items and lets you look up items by specifying a string of characters or words that you want to find. You can also edit and delete items. Items entered into InfoBox can be written to and read from cassette and disk files. All or selected items can be printed on a parallel or serial printer. InfoBox occupies 3K. Specify cassette or disk version. \(\mathbf{\$ 2 9 . 9 5}\)

prices on this high-quality software. Buy direct and save 50\%. Now, also available for CBASIC on CP/M and MBASIC on HEATH HDOS.

\section*{DATA BASE MANAGER}

Mod-I \$69 Mod-II \$199
You can use it to maintain a data base \& produce reports without any user programming. Define file parameters \& report formats on-line. Key random access, fast multi-key sort, field arith., label, audit log. No timeconsuming overlays. 500 happy users in a year. Mod-ll version with over 50 enhancements.
A/R
Mod-I \$69 Mod-II \$149
Invoices, statements, aging, sales analysis, credit checking, form input, order entry. As opposed to most other A/R, ours can be used by doctors. store managers, etc

\section*{WORD PROCESSOR}

Mod-I \(\$ 49\) Mod-II \(\mathbf{\$ 4 9}\)
Center, justification, page numbering... Used for letters, manuals, and reports. Mod-I version features upper/lower case without hardware change!

\section*{MAILING LIST}

Mod-I \(\mathbf{\$ 5 9}\) Mod-II \(\mathbf{S 9 9}\)
The best! Compare and be selective. Form input. 5-digit selection code, zip code ext., sort any field, multiple labels. Who else offers a report writer? INVENTORY

Mod-I \(\$ 99\) Mod-II \(\mathbf{\$ 1 4 9}\)
Fast, key random access. Reports include order info, performance summary, E.O.O. and user-specified reports. Many converted their inventory to ours!
PAYROLL. A/R, A/P, and GL available for the Mod-II DOS and CP/M.
L216. a cassette package of 10 business programs for Level II 16 K systems, \(\$ 59\).
All programs are on-line, interactive, random access, virtually bug free, documented and delivered on disks. Mod-I programs require 32 k TRSDOS and credit is allowed when you upgrade to Mod-II. We challenge ali software vendors to offer low cost manuals so you can compare and avoid those high-priced, undocumented, 'on-memory' programs. Manuals alone \(\$ 5\) for Mod-I, \(\$ 10\) for Mod-II. Don't let our low prices fool you!
Mod-ll programs are extensively modified, guaranteed to run with 1 year newsletter and updates. 10\% off for ordering more than 1 Mod-ll program.

Table 2. Reproductive Tract Health Items
record (JCOW) number. These two variables let you check for errors. If either number brought into RAM is not what you expect, an error message is printed and processing is stopped until the problem is fixed. If parts of the disk become unreadable, the two variables may help in retrieving what is readable.

Dates are stored repeatedly in all three records. These are not calendar dates, but numbers relative to a fixed day. (See Listing 1.) January 1,1968 is my constant date 1. Date 366 is December 31, 1968 (a leap year), and date 367 is January 1, 1969.
A date constant lets you store a date as an integer. It also lets you find out how many days have elapsed since a specific task was performed. Date constants ignore the number of days in a month.

Software can make these transformations invisible; the farmer will input calendar dates and receive results in the usual month/day/year format.
Note in Table 1 that every entry on the disk is a two-byte integer. First come the animal and record (disk location) numbers for error checking. Next are the animal status codes showing the last date of antibiotic use, birthdate of the cow, and pen or corral number of her current location. Next is a set of codes for five different vaccinations.
Sex and calving status (see Table 4 for my definitions) will speed up generating reports
where the complete disk is searched. The next value will range from 0 through 8 , indicating how many calvings are in the record for the cow. Each calving set has eight codes: the date, calf sex, calf status at birth (normal, large, etc.), four cow status codes at time of giving birth (normal, milk fever, etc.) and the calf's sire.
If artificial insemination is used, the two codes on breeding availability and bull to use can be preset. The employee can then receive instructions on what action to take if the cow is in estrus.
The next value will range from 0 through 8, indicating how many heats and breedings are in the record. Each breeding set has five variables: heat date, who saw the heat, date bred, semen used and who did the inseminating. When a calving is reported for the cow, this last group of data is zeroed, because only data since the last calving is important.
Table 2 describes the second record. The animal and record (disk location) numbers are for error checking. Next come three codes for flagging cows that need special observation or treatments. The code definitions are in Table 4.

The placenta code is for the status at time of calving, and the vaginal discharge code is for following through after calving to detect metritis. The tract status at insemination flags any
abnormalities at time of breeding.

The next value will range from 0 through 11 and indicate how many reproductive observation sets are in the record. Each set has four variables: date observed, the problem (e.g., metritis, not ovulating), the route of treatment (e.g., intravenous, intramuscular), and a 15-place alphanumeric string to describe the treatment.

Forget trying to encode this with integers. Let the farmer type on the keyboard what seems best. Although this will use more disk space, the task of creating codes for all possible treatments found at the farm is doomed to fallure.

You may find that 15 characters are too few. Another alternative is 24 characters to the treatment string and eight instead of 11 stored sets. Remember the 256 -byte constraint.

Table 3 describes record 3. The animal and record (disk location) numbers are for error checking. The next value will range from 0 to 11 , indicating how many health sets are in the record. Each set has four variables; date observed, problem code (a short list can suffice if "other" is included), the route of treatment (oral, intramammary, etc.) and a 15-place alphanumeric string for comments.

\section*{Demonstration Software}

The hardware includes a TRS-80 Model I with 48K of RAM, a printer and two disk drives. The first drive stores the software; the second drive stores only animal data. Version 2.2 of TRSDOS and disk BASIC are used. A structured programming approach results in several short subroutines.

The following previously defined reports and tasks were programmed and debugged: not pregnant for \(X\) days or more; add a new animal; calving information; health (not reproductive) problems and treatments; delete an animal; calvings; and health items (not reproductive).

These will demonstrate the system.

Much effort went into building what I call overhead subroutines and standardized arrays.

Each of the three records need to be opened, fielded, read from disk to buffer and reset into RAM variables. Then the steps need to be reversed to store data on the disk. Individual subroutines do these jobs.

If more than 100 animals are to be recorded, another subroutine waits for a different disk to be loaded into drive 2. The two date-transformation subroutines are overhead.

All the arrays are defined and dimensioned in the main program. Management action report 5, not pregnant for \(X\) days or more, was the only one activated. To activate the next report requires only a few subroutine calls, some manipulation of already-defined variables and a few print statements.

The software has 632 lines, including remarks. Using the PRINT MEM command before and after loading the program into RAM indicates the program size is almost 24 K .

After running the program to dump one record for a cow,

PRINT MEM indicates the program plus execution space required ( 26.9 K ). This leaves only 10.7 K of space to add options to the program. Given the hardware and software used, all options cannot be activated in one big program.

\section*{Some Variables}

A complete dairy livestock
management system should include milk weights. Each milk weight will be a decimal number using four bytes of space. Two observations per day for 31 days requires 248 bytes, nearly a record. Part of a second record is needed on the few farms that milk three times per day.

If you try to integrate milk weights with breeding, calving

ana nealth data on a single diskette, the result may have to be quite different from Tables 1, 2 and 3.
The formats l've discussed are designed for breeding livestock using artificial insemination. If natural service is used, much of the herd reproductive approach becomes irrelevant. Most of record 1 and all of record 2 is not needed.
In feeder operations (beef, hogs, lambs) the file formats should be devoted more to preventive health strategies, daily feed amounts and weight gains. As in the dairy example, disk space is the first problem to consider.

A different approach would involve a series of separate programs, one for input and another for generating reports or editing. Redundant program lines make writing the second and third programs easier.

One disadvantage to this is that the farm worker has to both load and run a series of different programs during each session and shuffle the data disks. But TRSDOS offers a chain option for automatically loading and running a different program.
In this project all data inputs are taken from the keyboard after a screen prompt. As soon as the input is read it is checked for errors. I devoted considerable attention to idiot-proofing. This is an adequate input technique given the speed with which the computer operates when moving among RAM, the screen and the keyboard.

\section*{Study Other Systems}

Several research herds have had computerized data storage and inventory programs created for them. The package developed for the U.S. Dept. of Agriculture's research herd at Beltsville, MD, is mentioned in the Journal of Dairy Science (May 1974, p. 611). The Michigan State University dairy research center at East Lansing uses another system.

Both systems can be studied for data handling procedures and coding schemes. The software accounts for many research functions and institutional inventory requirements
not needed in a privately owned herd.

The herd reproductive management concept has been implemented on several computers. A mail-in batch-operated software package written in PL-1 was created and field tested on several dairy farms by Virginia Polytechnic Institute and State University.

I set up software in FORTRAN on an interactive time-share computer operated by the MichIgan State University Cooperative Extension Service. It was tested on only two herds, and remains available on a trial basis.

At least one private firm, Herd Reproductive Services, Inc., Athens, GA, has developed software for managing herd reproduction. This firm will provide a farmer with a minicomputer, the software and monthly consult-
ing services.
Opportunities exist for creating management-oriented livestock breeding and health record systems on microcomputers. However, the planning process will take time and demand a thorough knowledge of livestock.

Perfect Add-Ons for Your Computer System!

The SIRIUS SYSTEMS 80- Senes of Floppy Disk add-ons are designed to provide unDisk add-ons are desinned versatity and performance for your computer. Consisting of four different add-ons there is a 80 + Series Floppy Disk to meet your need. All 80 - Series Floppy Disk are compabbie with the TRS-80- and come ready to plug in!

\section*{COMMON CHARACTERISTICS}
- 5 ms track-lo-track access time

Aulo-enc
180 day WARRAWTY
Exceptonal speed stability - \(112 \%\)
Single density (FM) or double density (MFM (2FM)
- Ultra high reiabity

2 year Power Suppy Warranty
- Mor any or all 80 + Series on the same cable!

Includes user accessiblie plugboard for dive recanfiguing
SPECIFIC CHARACTERISTICS
The SIRIUS \(80+1\) is a single sided. 40 track. highly reliable Floppy Disk add-on Ottering 5 more tracks than the Radio Shack model, it cos: \(\$ 140\) less! Formatted data storage is \(102 \mathrm{~K} / 20 \mathrm{~K}\) bytes single/double density.
SIRIUS \(80+1\)
\(\$ 359.95\)
The SIRIUS \(80+2\) is a dual sided. 70 track ( 35 per side), highly versatie Floppy Disk unt It appears to the TRS. 80 - as TWO 35 track drves yer COST LESS THAN HALF THE PRICEI Even greater savings result, since data is recorded on both sides of the media instead of only a single side. Using the plug Doard. It may be recon figured for other computer systerns? (The \(80+2\) operates as Drive 0 and any of the other three addresses (with the sandard Radio Shack Cabie)
or as any of four drives (with the SS Standad or as any of four drves (with the SS Standad 161.2 K bytes single/double densify

SIRIUS \(80+2\)
\$449.95
The SIRIUS \(80+3\) is a single sided, 80 track. Quad density Floppy Disk unit Oftering 24 umes the storage of a Standard Radio Shack inve, the \(80+3\) greatty reduces the need for diskettes correspondingly. Additionally. because of the increased storage and faster track-to-track access time, the \(80+3\) allows tremendously increased throughput for disk based programs "! The \(80+3\) INCLUDES SIRIUS's TRAKS-PATCH on Diskette Formatted data storage is \(204 \mathrm{~K} / 40 \mathrm{ks}\) bytes single/doubie density
SIRIUS \(80-3 \quad \$ 489.95\)
The SIRIUS \(80+4\) Floppy Disk add-on is a double sided. 160 track ( 80 per side). 514 monstert The utimate in state-of-the-art 54 : Floppy Disk technology, to \(80-4\) is seen by the TRS-80- as two single sided disk drives, each with 80 tracks Thus, in terms of capacity one \(30+4\) is equivalent to \(4^{2}\) ) standard Radio Shack drives - a savings of over \(73 \%\) (not to mention diskettes '11) (With a double density converter. the available memory is huge') The \(80+4\) is similar to the \(80+2\) in that it arnves configured
as Drive 0 and any of the other three addresses as Drive 0 and any of the other three addresses (with the standard Radio Shack Cabie) or as any of tour drives (with the SS Standard Cable) The The plug board is also included ) Formatted The plug board is also included) Formatted data storape is 408 K suingle density or 816 K
bytes double density. ytes double density
SIRIUS \(80+4\)
\$624.95

All 80 - Series Floppy Disk add-ons operate a 5 milliseconds track-to-track access time (eight imes faster than the SA 400) but are Expansion Interface Limited to 12 mili-seconds for the TRS 80
-TRS-80t Tandy Corp

SPECIFIC HARDWARE
FEATURES INCLUDE:
- Control of up to twelve Floppy Disk Drves (eight 8 andlor four 51/4
- 8" and/or 51/4 Disk Drve Utilization
- Single (FM) or Double (MFM) density data Storage
- Hard or Soff sectored diskette usage
- Ubiczation of "Ouad densily (96 tipi) 8" or
- Control of Drves
- Control of up to four WINCHESTER Dpe

PRIAM DISKOS Disk Drives
- 8 or 14 may intermor on the same cable
- Accommodates 8 andior 14 drives of 53 Mbytes to 154 Mbytes
- Extremely flewble host-controlier intertacing

SPECIFIC SOFTWARE
FEATURES INCLUDE:
- Dynamic format modifications via command words
- Extremely flexibie format acceptance for unusual data storage formats
- Easily interfaces to standard operating sys tems (TRS-DOS: CP/M... , etc)
- Operates in erther get/put sector mode or data string mode
- Performance parameters may be changed by EPROM replacement or Dynaminic Repro gramming

Dedicated systems cards are also avalable on a limited basis for the STD-BUS and the S 100 These cards feature shared memory also fagain software selectable) in addition to the regular sofware seiectabie) in addition to the regular
OMEGA Series Controiler Module features. ConOMEGA Series Controiler Module features. Con-
suit SIRIUS SYTEMS for current price and availability for the entire line of OMEGA Series Memory Units and Controliers Deaier inquiries are invited.

\section*{Set your memory size from BASIC.}

\section*{Memory Sizer}

\author{
Jack Decker \\ 1804 West 18th Street Lot 155 \\ Sault Ste. Marie, MI 49783
}

In magazines such as this one, you often see hybrid programs. Written in BASIC, they use a machine language subroutine called by the USR(X) function during execution.

The author of the program usually tries to make the loading procedure more convenient by embedding the machine language code in DATA statements within the BASIC program.

\section*{Overwriting}

These DATA statements are usually read by a FOR-NEXT loop that POKEs it into its proper location in memory. Already you can see a source of potential problems, since the code is POKEd without regard to whatever else may already be there.

If you have KBFIX or some other machine language routine loaded and the BASIC program overwrites it, tough luck-you
have just lost your routine and maybe hung up your computer in the bargain.
What's that, you say? I forgot that I had to turn off the computer, power up again, and answer the MEMORY SIZE? question to protect some machine language memory.
Yes, that does destroy any machine programs residing in memory. Now, what was that MEMORY SIZE? Had it written down somewhere. Should have written it on the cassette label, I suppose. Suddenly this "convenient" program leaves something to be desired.
All of these troubles can be avoided. For instance, Listing 1 shows one unusual method that will work when the machine code to be used is less than 256 bytes long and is completely relocatable. For demonstration purposes I'll use a machine program that places ASCII codes corresponding to the contents of register pair HL in the upper right-hand corner of the video display.
The machine language routine is stored in string variable B\$. VARPTR(B\$) returns the address of the string's first three memory locations containing
the length of the string, the least significant byte and the most significant byte. If you POKE these latter two bytes into locations 16526 and 16527, the USR \((X)\) locations, then \(B \$\) will be treated as a machine language program when the USR function is called.

Note that if the VARPTR locations are greater than 32767, as they could be in a system with more than 16 K of memory, you must subtract 65536 to keep the POKE command within allowable limits.

If \(\mathrm{B} \$\) is the first string variable to be assigned in a program, it will stay in the same location. However, if you choose to assign other string variables first, and if the length of those variables will be changed during the run of the program, then you'll have to find \(B \$\) in memory before executing the USR call. You can do this by repeating the commands in line 30 just before making each USR call. (This could be done in a subroutine.)

\section*{Avoid Power Up}

The above method works for most relocatable machine language routines. But you can locate your routine in high mem.
ory, and avoid powering up the computer to set the memory size. Let's examine what happens when you answer the MEMORY SIZE? question.

As far as I can tell, the main locations for the memory size are 16561 and 16562. When you type a number in response to the memory size prompt, the computer subtracts 2 and stores that number in 16561 and 16562. So if you ever forget what memory size you started with, you can type:
? PEEK (16561) + PEEK (16562) \(256+2\)
and the computer will tell you.
Actually, the address in those locations represents the highest usable memory location for BASIC, normally used for string storage. So, for example, if you set the memory size to 30000 , the last location available for string storage (or other BASIC variables, if no string space is cleared) is 29998. You could start your machine program at 29999 with no ill effects.

But you can't just POKE the new value minus 2 into 16561 and 16562 to reset the memory size. Other pointers must also be reset-those that govern the

}

\section*{REAL VALUE}

AEROCOMP offers the best value in microcomputer disc drives on the market today! Reliability, features and cost tough to beat. We deliver...and we stand behind our products, as evidenced by the only FREE TRIAL OFFER in the industry. Examine your systems needs and order today!

\section*{MYSTERY REMOVED}

There appears to be some confusion in the terminology used to describe disc drives and their features. Here's what we mean:
-FLIPPY Allows the use of both sides of a diskette with a singleheaded drive by simply turning the diskette over (Model 40-1),
-TRACX specified in tracks per inch DENSITY
-DOUBL DENSITY
(T P I ).
Refers to the number of tracks per radial inch on the diskette. Typically \(48 \quad \mathrm{TPI}=40\) usable tracks and \(96 \mathrm{TPI}=80\) useable tracks.
refers to recording density in bits per inch (bpi). Typically single density means data can be recorded up to 2.938 bpi ; double density means data can be recorded up to \(5,876 \mathrm{bpi}\).
-OOUBLE
refers to number of read/write heads. Single-sided is one head, read/write one side only; double-sided is dual heads allowing read/write operations on both sides of the diskette. A double sided drive appears as two separate appears as two se
- CAPACITY unformated capacity is the total amount of storage space available on a diskette. Typically 125 K bytes on a 40 track 5.25 in. diskette. Formated capacity is the total USABLE storage space on a diskette. Typically 102 K bytes on a 40 track 5.25 in. diskette.
the time required for the head
TIME to move from one track to the next. Typically 5 to 40 milliseconds (ms).

\section*{FREE TRIAL OFFER}

Order your AEROCOMP Disc Drive and use it with your system for up to 14 days. If you are not satisfied for ANY REASON (except misuse or improper handling), return it, packed in the origina shipping container, for a FULL REFUND. We have shipping container, for a FULL REFUND. We have
complete confidence in our products and we know you will be satisfied! ORDER TODAY!

\section*{MARRANTY}

We offer you a 90 day unconditional warranty on parts and labor against any defect in materials and workmanship. In the event service, for any reason, becomes necessary, our service department is fast, friendly and cooperative.

\section*{\(100 \%\) TESTED}

AEROCOMP Disc Drives are completely assembled at the factory and ready to plug in when you receive them. Each drive is \(100 \%\) bench tested prior to shipment. We even enclose a copy of the test checklist, signed by the test technician, with every drive. AEROCOMP MEANS RELIABILITY! ORDER NOW

start of string storage and the position of variables in memory.

Fortunately, you don't have to reset each one individually. All you need to do is issue a CLEAR \(X\) command where \(X\) is the number of bytes you need cleared for the program. The \(X\) argument must not be omitted, even if you don't need any string space cleared, because that also resets a pointer. If you don't need any string space, you can just CLEAR 0 .

Using the above information, if you wanted to reset the memory size to 30000 , you could issue these commands:

POKE 16561.46 : POKE 16562.117 CLEAR 50
\(46+117 \cdot 256=29998\), or 2 less than our desired memory size.

However, if your machine language routine is relocatable, you can go one better than this. You can reserve enough memory for your routine while the program is running, and then free that memory for other uses when the program is finished.

\section*{Freeing Memory}

Take a look at Listing 2. The code is compressed with multiple statements on a line, so keep in mind that everything between lines 1 and 2 is part of line 1 , and so on. Here is how the program works.
First, POKE 16396,23. This disables the break key since you don't want to exit the program without executing line 9999. You then PEEK at the present memory size in locations 16561 and 16562, and let variable \(C\) equal the present memory size minus the length (in bytes) of your machine routine. This will be your new memory size.
Poke your present memory size into 16526 and 16527. This is temporary since you want to recover these values after you issue the CLEAR command (which clears all variables). You could just as easily have used any of several other memory pairs to store these values, but these are the USR(X) locations that you will be using later anyway.

Next you break your new memory size down into least significant and most significant bytes (LSB and MSB), and POKE these back into 16561 and 16562. Then comes the mandatory CLEAR command (be sure to replace SC with a numeric argument).

Starting in line 2, you recover your original memory size from the USR(X) locations and store them in variables \(Q Y\) and \(Q Z\) (to be used at the end of the pro. gram). Now we PEEK at your new memory size and add 1 to it to determine where your machine program will start (variable C).

If the entry point (the byte of the routine to be accessed first) is not the first byte of the routine, you must calculate the entry address by adding the dis. placement from the start of the program (variable D). Break this entry point address down into LSB and MSB and POKE it into the USR \((\mathrm{X})\) locations ( 16526 and 16527). You then do the actual POKEing of your routine into memory, starting at the first location of your newly protected memory.

If the memory location indicated is greater than 32767, you must include the offset of -65536. This necessitates the function ( \(A>32767\) ).65536 shown in the example. Note that

PL indicates the program length and must be replaced by the number of bytes to be POKEd from DATA statements.

\section*{Restoring and Modifying}

At the end of your program, line 9999 in this example, you need only rePOKE the old memory size into 16561 and 16562 . issue the necessary CLEAR, and POKE 16396,201 to re-enable the break key. This restores everything to the way it was before you ran the program, without any need to power up again. Note that QY and QZ are the only variables that must be left unchanged throughout the program.

The above routines can also be modified to put a system machine code in your programs, that is, code that stays in memory and is used in the command mode.

Should you use one of the above routines, I would also suggest you use the CLEARX statement at the beginning of every program; you never know how much memory was reserved for strings in your last program. Finally, if your program really hogs the string space, issue a CLEAR 50 at program end so that you can load the next program without encountering an OM ERROR (out of memory error).
```

10 FOR A=1 TO 4: READ B: BS=BS+CuRS(B): NEXT
20 DATA 34, 62, 60, 201

\title{
H-14, Meet the TRS-80
}

\author{
Frank Friesen \\ 23 Gemini Avenue Winnipeg, Manitoba \\ Canada R2G OT5
}

After owning my TRS-80 for a while I became tired of copying programs from the screen by hand. I needed a printer. The H-14 line printer from Heathkit seemed to be the best buy. The kit cost less than half the amount of the Radio Shack line printer and even had lowercase.
The kit took only 12 evenings to finish, but while building it I realized that the on board CPU and software controlled UART could not easily be bypassed, as I had hoped. This meant that the only way I could communicate with the printer was by serial means.
The RS 232 or 20 ma current loop could be bypassed so that information could come, via TTL levels. The problem was the expansion interface which puts out parallel information. This wasn't going to stop me-the price difference in printers could pay for a mini disk drive.

Looking around my workshop I saw an MM5303 general pur-
pose UART (Universal Asyncronous Receiver Transmitter). Using this IC, a 74LSOO quad 2 input NAND gate and some extra wiring to the Heathkit control board, I made a working interface.

\section*{Circuit Operation}

The circuit is simple and easy to understand (see Fig. 1). Parallel information is input to the UART (IC 1) from the expansion interface line-printer-port edge connector. Upon receiving the strobe on pin 23, the UART begins transmitting this data serially on pin 25 (SIN).

The format will be eight bits, with no parity, and one stop bit, as set by the voltage levels on pins 35 to 38 of IC 1 . During this transmission, the COMPLETE signal, pin 24, of the UART, goes low. It causes pin 11 of IC 2 to go high, indicating to the computer that the printer, or at least the interface circuit, is busy.
When transmission is complete, pin 24 of the UART goes high, causing pin 11 of IC 2 to go low, indicating the printer is ready to receive more information.

The circuit derives its power from the H-14 line printer. Also the CLK signal on pin 40 , which is used by the UART for timing and clocking the data, is taken
directly from the UART in the H-14. This means that any baud rate set in the H-14 will be automatically set in the interface as well (not including 110 baud, since this requires two stop bits, not one as is set now). I run mine at 4800 baud with no problems.

The H -14 provides one handshaking signal, RTS, which goes low if the printer is off line or the print buffer is full. This signal is gated through IC2 to the line printer port. In this way, either the printer or the UART can cause a PRINTER BUSY signal.

The strobe signal is run through two gates simply to give the data lines a little additional time to stabilize before being strobed. Pin 23 on the edge connector is tied to pin 24 (GND) to disable the fault detect line since it is not needed.

\section*{Construction}

I built the circuit on a preetched experimenter board that holds both IC's. I also used sockets to avoid unsoldering problems in the future.

Set a common +5 volt area and a common GND area and make the following connections:
1. Pins \(3,21,36, \& 39\) of IC 1 to the common GND
2. Pins \(1,38,37,35 \& 34\) of IC 1
to the common +5 volts
3. Pin 24 of IC 1 to Pin 13 of IC 2
4. Pin 23 of IC 1 to \(\operatorname{Pin} 6\) of IC 2
5. Pins \(3,4 \& 5\) of IC 2 TOGETHER
6. Pin 14 of IC 2 to +5 volts
7. Pin 7 of IC 2 to GND

All that remains now is to wire the two interconnection cables. I made the cable to the H-14 out of six three-foot pieces of \#24 stranded wire simply because I had them available. Six-conductor ribbon cable would also be suitable. Using different colored wires can make identification easier.

Before starting to wire the \(\mathrm{H}-14\), remove the jumper wire from J114,J115 or J114, J113. This interface circuitry is bypassed and the associated ICs could be removed (U101, U102, U103, U104).

Remove the bottom plate of the \(\mathrm{H}-14\) and make the following connections to the control board, using the six-wire cable. Be sure to count the pins correctly. Viewing from the bottom puts pin 1 on the opposite side. Also, be careful not to make any accidental solder bridges to other pins.

The U numbers refer to \(\mathrm{H}-14\) ICs and the others to the ICs on the board just completed.
1. One wire to IC U105 Pin 40;
the other end to the +5 volt common.
2. One wire to IC U105 Pin 32 (RTS); other end to IC 2 Pin 12.
3. One wire to IC U105 Pin 20; other end to common GND.
4. One wire to IC U105 Pin 15 (CLK); other end to IC 1 Pin 40.
5. One wire to IC U105 Pin 10 (SIN); other end to IC 1 Pin 25.
6. Last wire to IC U104 Pin 1 (-12); other end to IC 1 Pin 2.

This completes the wiring to the H-14.

Run the cable through the slot in the base plate. Re-install the
base plate. Be sure the cable does not interfere with the print head movement.

For the second cable I used a ten-conductor ribbon cable about 15 inches long. I could not find a 34 -pin female connector to mate with the expansion in-

Figure 1.
terface card edge, so I used a 40-pin connector and simply cut off the pins I did not need.

The pin configuration of the line printer port is shown in the expansion interface manual. Pin 1 is the pin on the top nearest the keyboard. Pin 2 is directly opposite on the bottom side of the board. Wire the cable as follows:
1. Connect one wire to Pin 1 of the connector; the other end to Pin 1 and 2 of IC 2.
2. One wire to Pin 2 of the connector; the other end to the common GND of the circuit board.
3. One wire to Pin 3 of the connector; the other end to Pin 26 of IC 1 (MM5303).
4. One wire to Pin 5 of the connector; the other end to Pin 27 of IC 1.
5. One wire to \(P\) in 7 of the connector; the other end to Pin 28 of IC 1.
6. One wire to \(\operatorname{Pin} 9\) of the connector; the other end to Pin 29 of IC 1.
7. One wire to Pin 11 of the connector; the other end to Pin 30 of IC 1.

8. One wire to Pin 13 of the connector; the other end to Pin 31 of IC1.
9. One wire to Pin 15 of the connector; the other end to Pin 32 of IC 1.
10. One wire to Pin 21 of the connector; the other end to Pin 11 of the IC 2.
11. Connect a small bare wire between Pin 23 and 24 on the connector itself.

\section*{Conclusion}

I put the completed interface into a small experimenter box and ran one cable out each side. As seen, the parts count is very low. Parts required are:
One MM5303 (or equiv) UART
One 74LS00 Quad 2 I/P NAND

GATE
One 40-pin socket (recommended)

One 14 -pin socket (recommended)

One 34-pin female connector (0.1-inch spacing)

Miscellaneous wire, PC board, etc.
The cost of the unit is less than \(\$ 15\).

I normally operate the \(\mathrm{H}-14\) using the manual switch to select character width. Because the printer driver routine only sends carriage returns (not line feeds), the dip switch (sw102) in the \(\mathrm{H}-14\), position 3 , should be set to 0 , causing an automatic line feed on carriage return. This works fine until I try to select a
new character width using this command:

LPRINT CHR\&(27); CHR\$(117); CHR\$(20)
The above command causes 96 characters per line. The only problem is that the \(\mathrm{H}-14\) will no longer generate internal line feeds. The easiest way around this is to generate a line feed from BASIC in a subroutine such as the following:

XXX PROGRAM LPRINT LINE: GOSUB 10000
10000 IF PEEK ( 14312 ) < 83 THEN 10000 ELSE POKE14312,10: RETURN

Line 10000 waits until the printer is ready and then sends a line feed directly, bypassing the
print driver routine.
If you change character width by software, calling this line in a program after the LPRINT line produces the line feed needed.

It is easy to see that this will not work with LLIST or LPRINT lines longer than the number of characters available on the line. To use LLIST you must use the manual mode and are limited to only the small or large characters. Note that the dip switch is sampled only at power up. This means if you change character size with software, you must turn the \(\mathrm{H}-14\) off and on again to get back the auto line feed function. If you use large characters, this is only a minor inconvenience.

Protected disk \(\$ 20.95\)

\section*{INVADERS FROM SPACE}
by Carl Miller from Acorn
"Maybe it's too fast!" Perferred by all the local arcade addicts, this machine language game has great sound. Alien Invasion, Invaders and Invaders Plus just can't compete. You can adjust parameters including the speed, if you think it's too fast. Only a few heroes will be able to save earth.
Protected tape \(\$ 14.95\)
Protected disk \(\$ 14.95\)

THE EmPIRE 5TRKKE5!

from Computer Simuations Company
The rebellion begins with one base and one warship. You take on fighters, conduct ground operations and secure planets, adding to the number of Rebel bases. Don't let any Empire Scoutcraft escape! You are the last hope. \(\$ 14.95\)

\section*{SUPERSCRIPT}
by Richard Wilkes from Acorn
"Scripsit" from Radio Shack is a great program. but it lacks some features. SuperScript adds features to your disk version of "Scripsit." Some of these features are:

You can get a directory or kill files from within SuperScript. TRSDOS or NEWDOS can read SuperScript files. You can insert text into unjustified lines during printout. For example. inserting a name after "Dear" and before the colon. For this purpose a lowercase driver is included.

On printers that can backspace, underlining and slashed zeroes ( \(f\) ) are options. On Diablo and NEC printers one can superscript, subscript. underline, boldface and select \(10 / 12\) pitch.

The keyboard driver is changed to allow a correct key repeat which is faster than tapping on a key and which does not destroy the video display. The initial character sent to the prnter is changed from a linefeed to a carriage return to empty the buffer. A required space may be specified when it is undesirable to place spaces between parts of text when justifying. From the keyboard you can also enter special characters such as brackets, braces and carets.

Serial and parallel drivers are included on the disk. You can customise these drivers for use with other types of letter quality printers. The serial drivers are included which use the ETX/ACK protocol for 1200 baud communications. Furthermore, printer drivers can be protected in high memory.

The "L" command used to load a file now requires a filespec to avoid destroying text buffer if the question mark is omitted from the "?L" command.

\section*{On disk for \(\$ 29.95\)}

\section*{STUCTURED BASIC \\ TRANSLATOR \\ by Gene Bellinger from Acorn}

Try structured programming. You can write programs using PROCEDURES, CALLS, CASE--CALLS, IF-THEN-ELSE, WHILE and UNTIL. Once written. SBT will quickly translate the structured code into an efficient BASIC program. Speeds up program development and documentation. The program is both fast (a 20k BASIC program in less than 4 minutes) and compact. Requires 32k and one disk drive. Supplied on disk for \(\$ 29.95\)

A sad tale of one user's efforts at homebrew interfacing.
}

\section*{Caveat Emptor}

\author{
M. Parris \\ 646 Island Park Drive \\ Ottawa, Ontario \\ Canada K1Y OB7
}

When I bought a TRS-80 it was with the expectation of using it with a hard copy device of some kind, and, until line-printer prices became more reasonable, this was almost certainly going to be the beat up Olivetti terminal I use-110 baud, RS232 compatible.
However, I didn't want to eliminate the option of eventual higher printing rates, sol looked around for some type of general purpose I/O interface. Radio Shack's RS232 board together with the necessary expansion interface cost a minimum of \(\$ 400\). On the other hand, with some pain, I might be able to design and build an I/O interface for about \$35.
Between these two extremes, the best bet appeared to be the TRS-80 Serial I/O board kit offered by Electronic Systems for \(\$ 59.95\) (connecting cable \(\$ 19.95\) extra), advertised with variable baud rate, variable bit count and parity and LPRINT, LLIST and BASIC input. My estimate of \$35 was based on Electronic Systems' parts list and current catalog prices, but the thought of hours of designing and fabricat-
ing a board was enough to persuade me to try the kit.

\section*{Still Waiting}

I sent away for the kit and waited over seven weeks for its arrival. Unpacking it, I was concerned that Electronic Systems had not taken any antistatic precautions. The components, jumbled together in a polyethylene bag, might have zapped some of the low power logic, diodeprotected or not. Several of the I.C. and socket pins were bent as a result of this packaging, and there was no component list (other than that appearing in the catalog).

Documentation consisted of a circuit diagram with no component values marked, a component placement diagram and two short driver routine listings, together with a note concerning baud rate, parity, data and stop bits selection via onboard dipswitches.

Ordinarily, the lack of component values wouldn't matter, if an accurate component placement diagram were included. However, in this case there was a discrepancy between the parts supplied and the parts necessary to assemble the board as per diagram. This particular hurdle was crossed by means of a few educated guesses and the purchase of one extra resistor. I did write to Electronics Systems by the way, enclosing an S.A.S.E. too, but didn't get any clarification.

There was need for some caution in attaching the 40 -conductor cable and its socket. The pin numbers were marked on the board in such a way that they appeared to reference the expansion port connector, in which case I might have easily connected the cable upside down. It's advisable to make certain (and mark the orientation) of cable connectors, board and TRS-80 expansion port before switching on the soldering iron!
The remainder of the assembly was easy. I'd decided that I might eventually want to introduce some subtleties into the UART's handshake, so I reinstated the switching arrangement which Electronic Systems had apparently removed in this revised version of the I/O board.

This involved mounting a dipswitch (the board was already drilled for it anyway) and cutting the foil at the five places where the switch elements had been strapped closed. Functionally, the circuit is unaltered provided the switches are closed.

\section*{No Reply}

Assembly complete, two clock adjustments had to be made for the baud rates. The 110 baud adjustment ( 1760 hz ) was an easy matter, but the \(150-2400\) baud clock ( 38.4 khz ) proved intractable and the trouble was eventually traced to a faulty gate in a CD4096-possibly static damaged.

Once again I wrote to Electronic Systems, suggesting they might like to send a replace-

Figure 1.

Figure 2.
ment-to date, though, l've had no reply!

In any event, I replaced the CD4096, successfully adjusted the clock and burned in the board for a few hours. The board required about \(130 \mathrm{~mA},+5 \mathrm{~V}\). and \(50 \mathrm{~mA},-12 \mathrm{~V}\). This would have been nice to know beforehand, but it was about what I'd expected and I'd already made the power supply anyway!

By this time I was more than a little concerned at the poor documentation supplied by Electronic Systems and thought it advisable to read over the routines supplied, one for LLIST, LPRINT, the other for BASIC input. Disassembly of the programs showed that the board's address was treated as 37F8 hex. Fig. 1 shows the address decoding logic in the circuit diagram which was supplied, and the address is clearly 37E8 hex, as, after all, it should be for the line printer driver routine in
that it doesn't insert into the socket, which sets A4 permanently high in the board address. A better method is to use a two pole, two way nonshorting switch to preserve compatibility with Electronic Systems' I/O routines.

\section*{Diagram Discrepancy}

Fig. 2 shows the other major circuit diagram discrepancy; neither U2 pin 22 ( \(\overline{\mathrm{TBE}}\) ) or U5 pin 2 is connected to U 2 pin 30 , but
they are connected together. The UART status is detected via U2 pins 31 and 28 only (D3 and D5), so that the board can't be used with the TRS-80 in-ROM line printer driver routine without some recoding of its status.

In Fig. 3 l've shown the changes I made, in addition to the board address change of course, in order to use in-ROM LLIST, LLPRINT without custom written software.

ROM.
But why capriciously use custom written I/O routines when there's an adequate one already in ROM?

I reckoned I should check the whole board against the circuit diagram. Among the several discrepancies revealed, which would have made troubleshooting from the diagram difficult or impossible, the most important was that A4 was not inverted. U1 was simply bypassed at pins 12 and 13 as indicated in Fig. 1. The board address was, after all, 37F8 hex and not 37E8 hex, making it impossible to use the board without Electronic Systems' routine.

The hardware fixup is easy enough. Cutting out the foil bypass and reconnecting U1 pin 12 to \(U 4\) pin 6 , the board address is restored to 37E8 hex. As a temporary, but less satisfactory expedient, U4 pin 6 can be isolated by bending the I.C. pin out so

Micro-Mega • P.O. Box Ge55 • Arfington, Va 2 e206

Hold it though! Even if these amendments are applied, there may yet be a problem. The inROM line printer driver routine assumes you have a line printer with auto line feed! If a line feed character (OA hex) is encountered, it's replaced by a trans parent null character ( 00 hex). (See the TRS-80 BASIC II ROM

39C-3C1 hex (924-961 decimal.) Unless your hard copy device is equipped with auto line feed or your serial I/O board is designed to deal with the problem you're out of luck!

Many other purchasers of Electronic Systems' TRS-80 Serial I/O Interface must have encountered these problems. To

Listing 3.
recap: I had a serial I/O interface that worked splendidly provided that I could use custom-written driver routines or that it could be made compatible with the TRS-80 ROM or Radio Shack software; but only if I had an auto line feed printer, which I didn't.

Listing 1 shows minimum changes which must be made to Radio Shack's Editor/Assembler program in order to make it directly compatible with Electronic Systems' TRS-80 Serial I/O Interface. Simply load the object tape of this routine after the EDTASM tape and run the program at 18058 decimal.

Listing 2 shows a comprehen-
sive line printer routine which completely replaces the in-ROM routines for LLIST, LPRINT more effectively than the (much shorter) routines Electronics Systems provided.

Listing 3 shows a BASIC loader program, the equivalent of Listing 2.

\section*{Conclusion}

My final verdict is that this serial I/O board will-just bare-ly-do what the manufacturers claim for it. Within these limits it works well, and can be made to work better. The design, however, was badly thought out and some customers might have trouble.

\section*{WHAT IS "THE PATCH"?}

We asked ourselves; WHY should our computer be as bland as everybody else's? Why not unlock the unused and wasted abilities available within each and every TRS-80 Model 1. These abilities allow the display to be dressed up and the computer to be effectively easier to use.

Now we have developed the means for getting the most from our computers and we know you need it too. With "THE PATCH" a new age of simplicity and convenience has arrived. You don't want to be left out, so don't kid yourself, you need the enhancements which "THE PATCH" provides.
* Does you keyboard bounce?

Some say, "I have a software fix for that!"
- Does your display still have that standard, dull, underline cursor?
Some brag, "We have a program which will give you a Block cursor, and it even will give you a Block cursor, and it even
- Does your Dualcase printer make you look foolish when you tell it to print lowercase because you could only see UPPERcase case because y
on the display?

Most cry, "We have a kit you can install ... and a program to run it!!!"
- Don't you have better uses for protected memory than to waste it on programs which are TOTALLY UNNECESSARY?

You sob, "I need all those advantages but they are just too much trouble to have all at once so I'll make do with what I have.

FORGET ALL THAT . . . make your
life easier
What we are trying to tell you is:
1. You CAN have Keyboard debounce if you need it!
2. You CAN have Block cursor with NO distracting blinking!
3. You CAN have FULL TIME Dualcase display!
4. You CAN have typewriter style keyboard operation!
5. You CAN have faster cassette data files, up to four and one-half times faster!
6. You CAN have even more features as we make them available.

All this from THE INSTANT you power up your computer, without making your other programs unusable because some unnecessary driver program is eating that memory.
"THE PATCH" is not a ROM. "THE PATCH" is not a PROM. "THE PATCH" is a microprocessor which modifies the Level II ROM to repair changes made by TANDY when they designed your computer. This state-of-the-art technology makes these changes possible without using ANY of your computer's memory. That means, any program you use on your computer now, will still work after you install "THE PATCH", including word processors.
"THE PATCH" fits easily into the Level II ROM sockets inside your computer, no cables or switches to install.

Sound too good to be true?? Call us. Tell us your innermost fears. Let us answer your questions. Do not cheat yourself out of using ALL of your computer's abilities ALL of the time.

\section*{ACCOUNTS PAYABLE}

The accounts payable system receives data concerning purchases from suppliers and produces checks in payment of outstanding invoices. in addition, it produces cash management reports. This system aids in tight financial control over all cash disbursements of the business. Several reports are available and supply information needed for the analysis of payments, expenses. purchases and cash requirements. All A/P data feeds General Ledger so that data is entered into the system just once. These programs were developed 5 years ago for the Wang micro-computer and have been tested in many environments since then. The package has been converted to the TRS-80" and is now a well documented, on-line, interactive micro-computer system with the capabilities of (or exceeding many larger systems.

\section*{ACCOUNTS RECEIVABLE}

The objective of a computerized \(A / R\) system is to prepare accurate and timeley monthly statements to credit customers. Management can generate information required to control the amount of credit extended and the collection of money owed in order to maximize profitable credit sales while minimizing losses from bad debts. The programs composing this system were developed 5 years ago, especially for small businesses using the Wang Microcomputer. They have been tested in many environments since then. Each module can be used stand alone or can feed General Ledger for a fully integrated system.

\section*{PAYROLL}

Payroll invoices many complex calculations and the production of reports and documents, many of which are required by government agencies. It is an ideal candidate for the computer. With this Payroll system in-house. you can promptly and accurately pay your employees and generate accruate documents/reports to management, employees, and appropriate government agencies concerning earnings, taxes, and other deductions. The package has been converted to the TRS-80'ت and is now a well documented, on-line, interactive micro-computer system with the capabilities of (or exceeding) many larger systems.

\section*{CAPABILITIES:}

\footnotetext{
* performs all necessary payroll tasks including: - file maintenance, pay data entry and verification - computation of pay and deduction amounts - printing of reports and checks
* can handle salaried and hourly employees
* employees can receive:
- hourly or salary wage
- vacation pay
- holiday pay
- piecework pay
- overtime pay
}
(Continued on next page)

\section*{CAPABILITIES}
* menu driven; easy to use; full screen prompting and cursor contro
* invoice oriented; everything revolves around the invoice; handies new invoice or credit memo or debit memo
* invoice information recorded; invoice \#. description, buyer, check register \#, invoice date, age date, amount of invoice, discount (in \%). freight, tax (\$), total payable
* transaction print and file maintenance procedures insure accuracy
* flexible check calculation procedure; allows checks to be calculated for a set of vendors - or - for specific vendors
* program prints your checks; contiguous computer checks with your company letterhead can be purchased from SBSG
* reports include (samples on back):
- open item listing/closed item listing - both detail and summary
- debit memo listing/credit memo listing
- aging
- check register report (to give an audit trail of checks printed)
- vendor listing and vendor activity (activity of the whole year)
* fully linked to GENERAL LEDGER; each invoice can be distributed to as many as five (5) different GL accounts; sysem automatically posts to cash and A/P accounts

\section*{CAPABILITIES}
* menu driven; easy to use; full screen prompting and cursor control
\(\star\) invoice oriented; invoices can be entered before ready for billing, when ready for billing, after billing or after paid
* allows entry of new invoice, credit memo, debit memo, or change/delete invoice
* allows for progress payment
* transaction information includes:
- type of A/R transaction
- customer P.O.
- description of P.O.
- billing date
- general ledger account number
- invoice amount
- shipping/transportation charges
- tax charges
- payment
- progress payment information
- transaction print and file maintenance procedures insure accuracy
* customer statements printed; computer statements with your company letterhead can be purchased from SBSG
* reports include; (samples on back)
- listing of invoices not yet billed
- open items (unpaid invoices)
- closed items (paid invoices)
- aging
* fully linked to General Ledger; will post to applicable accounts: debits A/R credits account you specify

\section*{(PAYROLL CAPABILITIES CONTINUED)}
* employees can be paid using any combination of pay types (except. hourly cannot receive salary \& salary cannot receive hourly)
* special non-taxable or taxable lump sums can be paid regularly or one time (bonus. rembursements, etc)
* health \& welfare deductions can be automatically calculated for each employee
* earnings-to-date are accumulated and added to permanent records. taxes are computed and deducted US income tax. Social Security tax, state income tax. other deductions (regular or one time)
* paychecks are printed computer checks with your company letterhead can be purchased from SBSG
* calculations are accumulated tor, employee pay history. 941 A report. W-2 report, insurance report. absentee report
* fully linked to General Ledger Each employee's payrollinformation can be distributed to as many as (12) twelve different GL accounts. system automatically posts to cash account

\section*{INVENTORY/CONTROL INVOICING}
- OVER 1000 ITEMS ON MODEL I
- OVER 3000 ITEMS ON MODEL II
- LOW STOCK ALARM
- INVOICING DEDUCTS FROM INVENTORY
- COMPLETE INVENTORY REPORTS
- REORDER POINT REPORT
- QUICK ITEM ACCESS

CLIENT BILLING. STOCK CONTROL. DENTAL BILLING. COMMODITIES Medicare/Medicaıd billing also available

\section*{MODEL I}

MODEL II

\section*{GENERAL LEDGER}

The General Ledger accounting system consolidates financial data from other accounting subsystems (A/R. A/P. Payroll, direct posting) in an accurate and timely manner Major reports include the Income Statement and Balance Sheet and a "special" report designed by management The beauty of this General Ledger system is that it is completely user formatted You "customize" the account numbers. descriptions, and report formats to suit your particular business requirements. These programs were developed 5 years ago for the Wang micro-computer and have been tested in many environments since then The package has been converted to the TRS-80" and is now a well documented, on-line, interactive microcomputer system with the capabilities of (or exceeding) many larger systems

\section*{CAPABILITIES}
* more than 200 chart of accounts can be handled
* account number structure is user defined and controlled
* more than 1.750 transactions may be entered via
- direct posting. done by hand validated against the account file before acceptance
- external posting: generated by A/R. A/P. Payroll or any other user source
* data is maintained and reported by
- month
- quarter
- year
- previous three quarters
* reports (samples on back) include
- trial balances
- income statement
- balance sheet
- special accounts reports and more
* user formats reports with the following designed as you wish
- tittes
- headings
- account numbers
- descriptions
- subtotals
- totals
- skip lines
- skip pages
* up to eight levels of totals - fully user designated
* menu driven, easy to use, full screen prompting and cursor control

\section*{MICROSOFT BABIC COMPILER}

With TRS \(80^{\circ 0}\) BASIC Compiler, your Levelll programs will run at record speeds! Compiled programs execute an average of \(3-10\) times faster than programs run under Level II. Make extensive use of integer operations, and get speeds \(20-30\) times faster than the interpreter.

Best of all, BASIC Compiler does it with BASIC, the language you already know. By compiling the same source code that your current BASIC interprets, BASIC Compiler adds speed with a minimum of effort.

And you get more BASIC features to program with, since features of Microsoft's Version 5.0 BASIC interpreter are included in the package. Features like the WHILE...WEND statement, long variable names, variable length records, and the CALL statement make programming easier. An exclusive BASIC Compiler feature lets you call FORTRAN and machine language subroutines much more easily than in Level II.

Simply type in and debug your program as usual, using the BASIC interpreter. Then enter a command line telling the computer what to compile and what options to use.

Voila! Highly optimized, 2.80 machine code that your computer executes in a flash! Run it now or save it for later. Your compiled program can be saved on disk for direct execution every time.

Want to market your programs? Compiled versions are ideal for distribution. You distribute only the object code, not the source, so your genius stays fully protected.

BASIC Compiler runs on your TRS-80" Model I with 48K and disk drive. The package includes BASIC Compiler, linking loader and BASIC library with complete documentation
*195.00

\section*{1980 INCOME TAX PAC}

Completely Revised - Latest Tax Tables. Fully Tested - Complete Manual and Documentation. The new version of the Income Tax Pacs are full of error catching codes making it impossible to make an error. Follow the simple Step By Step procedure that makes tax preparation simple.
INCOME TAX PAC A.
(*19.95...Cassette)
For Level II 16 K Cassette Only
Does Form 1040 and 1040A
Schedule A itemized deductions
Schedule B interest and dividends
Output to video display
Schedule TC tax computation
INCOME TAX PAC B......................49.95...Cassette or Diskette)
For Level II 16 K with or without printer...cassette or disk has all features of Income Tax Pac A Plus works with or without line printer.

Formats Form 1040 and 1040A for standard tax forms
Schedule C income from a personally owned business
Form 2106 employee business expense
PROFESSIONAL INCOME TAX PAC C.
.99.95...Diskette
For Level II 32 K with disk and printer (optional)
Has all features of Income Tax Pac B Plus automatic memory storage for income tax preparers.

22 additional schedules and forms
Formats forms for individual or tractor feed printing
MOD II CPA VERSION

\section*{OUARANTEED PROFTI}

THE HORSE BELECTOR II (FLAT8) (By Dr. Hal Davis
\(\$ 50.00\)
Vew simplified version of the original Horse Selector. The first Horse Selection System o actually calculate the estimated odds of each horse.
-IIGHER PROFITS (OVER 100\%) POSSIBLE THROUGH SELECTVE BETTING ON:
- Rates each horse in 10 seconds.
- Easy to follow rules.
- Can be used with any Apple II Computer.
- 100\% money back guarantee (returned for any reason).
- Uses 4 factors (speed rating, track variant, distance of the present race, distance of the last race).
- Ulsing the above factors, the Horse Selector caiculates the estimated odds. BET on horses whose actual payoff (from the Tote Board or Moming Lines) is higher than payoff based on estimated odds.
- Using the above factors, the Horse Selector calculates the estimated odds. BET on any selected horse with an estimated payoff (based on Tote Board or Morning Lines) higher than calculated payoff (based on Horse Selector II).
- Source listing for the TRS \(80^{\circ "}, 7-59\), HP-67, HP-41. Apple and BASIC Computers. - No computer or calculator necessary (although a calculator would be helpful for the simple division used to calculate estimated odds).
TREE Dutching Tables allows betting on 2 or more horses with a guaranteed profit.

\section*{NEWDO8/80}

A New enhanced NEWDOS for TRS80'" Model I for the 1980's
Apparat Inc., announces the most powerful Disk Operating System for the TRS-80 \({ }^{\text {Te }}\). It has been designed for the sophisticated user and professional programmer who demands the ultimate in disk operating systems.

NEWDOS/80 is not meant to replace the present version of NEWDOS 2. 1 which satisfies most users, but is a carefully planned upward enhancement, which significantly extends NEWDOS 2. 1's capabilities. This new member to the Apparat NEWDOS' family is upward compatible with present NEWDOS 2.1 and is supplied on Diskette, complete with enhanced NEWDOS + utility programs and documentation. Some of the NEWDOS/80 features are:
- New BASIC commands that supports with variable record lengths up to 4095 Bytes long.
- New BASIC commands that supports with variable record lengths up to 4095 Bytes long.
- Mix or match disk drives. Supports any track count from 18 to 80 . Use 35, 40 or 77 track 5" mini disk drives or \(8^{\prime \prime}\) disk drives, or any combination.
- A security boot-up for BASIC or machine code application programs. User never sees "DOSREADY" or "READY' and is unable to "BREAK", clear screen, or issue any direct BASIC statement including "LIST."
- New editing commands that allow program lines to be deleted from one location and moved to another or to allow the duplication of a program line with the deletion of the original.
- Enhanced and improved RENUMBER that allows relocation of subroutines.
- Powerful program chaining.
- Device hanging for routing to display and printer simultaneously.
- CDE function; simultaneous striking of the C. D and E keys will allow user to enter a mini-DOS to perform some DOS commands without disturbing the resident program.
- Upward compatible with NEWDOS 2. 1 and TRSDOS 2.3.
- Includes Superzap 3.0 and all Apparat 2.1 utilities.
149.00

\section*{STOCK MARKET MONITOR}

Galactic Software Ltd.
CASSETTE VERSION . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . \(8 \mathbf{8 9 . 0 0}\)
DISK VERSION . \(\$ 99.00\)
1. The system is designed for the active "trader" not the "long term" investor, as the system is "technically" oriented.
2. For the TRS \(80^{\circ *}\) Model I, Level II, 16 K or more. Available in both disk and tape versions.
3. Tracks user selected issues, in a technical system that reflects the issue's performance against the overall market.
4. Set up data is input by the user from the Standard and Poors stock guide or Value Line.
5. Daily issue data, "high", "low", "close" and "volume" are input from any newspaper containing this information.
6. Daily overall market, "volume" and "closing Dow" are also provided from a newspaper.
7. Volume and price changes of an issue, as they compare to volume an price changes of the overall market, are the basis of this system's analysis of the given issue.
8. Comparisons of the issue against itself are also done. This may allow the user to spot "unusual" activity on this issue.
9. Clear indications are given as to whether the issue is "out performing", "under performing" or "performing" with the market.
10. Complete video and printed output is provided.
11. This program is intended to be a guide to indications, and is not to be used as a sole recommendation to buy, sell or hold an issue. These decisions are the responsibility of the user and his brokerage.

\section*{MOD-II PROGRAMS CURRENTLY AVAILABLE}
(1) ELECTRIC PENCIL (Michael Shrayer Software).....Complete word processor with extensive editing and printer formatting features..... \(\$ 275\) (STANDARD CP/M VERSION).... \(\$ 300\) (DIABLO, NEC OR QUME CP/M VERSION)..... \(\$ 325\) (STANDARD TRSDOS VERSION)..... \(\$ 350\) (DIABLO, NEC OR QUME TRSDOS VERSION).
(2) GENERAL LEDGER, ACCOUNTS RECEIVABLE, ACCOUNTS PAYABLE, INVENTORY CONTROL AND PAYROLL (SmalI BUSIRESS Systems Group).....works under TRSDOS.....can be used one module at a time or as a coordinated system..... \(\$ 225\) per module..... \(\$ 995\) for the complete system.
(3) GENERAL LEDGER, ACCOUNTS RECEIVABLE, ACCOUNTS PAYABLE, INVENTORY CONTROL AND PAYROLL (Peachtree Software).... requires CP/M and MICROSOFT BASIC.....professional business systems.....turn key operation.....discounts available..... \(\$ 1000\) per module ..... \(\$ 5000\) for the complete system.
(4) SELECTOR III (Micro-Ap).....complete data management system......user defined fields and codes.....manages any list defined by the user.. includes additional modules for simplified inventory control, accounts receivable and accounts payable.....requires CBASIC-2 and CP/M ..... \(\$ 295\).
(5) GLECTOR (Micro-Ap).....add on package to the SELECTOR III.....general ledger that allows the user to define a customized chart of accounts..... \(\$ 250\).
(6) GSF (Racet Computers).....Generalized Subroutine Facility..... a series of super fast machine language utilities that can be called from a BASIC program (no machine language knowledge required).....sorts 1000 items in under 5 seconds..... allows PEEK and POKE statements... move data blocks.....compress and uncompress data.....works under TRSDOS..... \(\$ 50\).
(7) DSM (Racet Computes)....Disk Sort Merge.....sorts and merges large multiple diskette files on a 1 to 4 drive system.....NOT AN IN MEMORY SORT.....can actually alphabetize (or any other type or sort) 4 disk drives worth of data.....sorts one complete disk of information in 10 minutes.....information is provided to use DSM with the RS MAILING PROGRAM.....works under TRSDOS..... \(\$ 150\).
(8) RSM (Small Systems Software)..... a machine language monitor and disassembler.....can be used to see and modify memory or disk sectors... contains all the commands found on the Model-I version plus some additional commands for the MOD-II..... works under TRSDOS.....\$39.95.
(9) CP/M (Lifeboat Associates)..... an alternative operating system to TRSDOS that allows users to use hundreds of programs currently available to CP/M owners..... This is the only version of CP/M for the MOD-II that comes with an elementary CP/M guide written especially for MOD-II owners.....\$170.
(10) MICROSOFT BASIC (Microsoft).....an enhanced version of the MICROSOFT BASIC found on TRSDOS.....works under CP/M.....adds commands such as chaining (allows the user to LOAD and RUN a new program without losing the variables currently in memory)..... Iong variable length file records. WHILE/WEND and others.....can be used with the BASIC COMPILER to speed up programs ( \(3-10\) times faster execution)..... \(\$ 350\).
(11) CBASIC-2.....a non-interactive BASIC used for many programs that run under CP/M.....requires CP/M.... allows user to make more efficient use of disk files.....eliminates the use of the most line number references....required for programs such as SELECTOR and GLECTOR...\$120.
(12) MAILING ADDRESS (Peachtree Software).....requires CP/M....keeps track of name and address information and allows the selective printing of the information in the form of mailing lists or address labels..... unique key structure and formatting structure allows for a multitude of retrieval alternatives..... \(\$ 790\).
(13) PROPERTY MANAGEMENT (Peachtree Software).....requires CP/M.....keeps track of all financial records related to property management .. \(\$ 1500\).
(14) FORTRAN-80 (Microsoft).....ANSI 66 (except for COMPLEX) plus many extensions.....requires CP/M.... \(\$ 425\).
(15) H\& E COMPUTRONICS, INC. SHARE-A-PROGRAM DISKETTE \#1.....works under TRSDOS.....a collection of programs written by MOD-II owners.....programs include data base management..... a word processor......mail system.....mortgage calculations.....checkbook register... and many others.....\$8 (add \(\$ 3\) postage outside of the United States, Canada and Mexico).....FREE if you send us a diskette containing a program that can be added to the SHARE-A-PROGRAM DISKETTE.
(16) MEMOREX OR WABASH CERTIFIED DISKETTES..... \(\$ 49.95\) (per box of 10).
(17) FLEXI-MATIC DISKETTE STORAGE TRAY.....Stores 110 diskettes.....comes complete with index-dividers, dust cover, tilt plates and adjustable spacing..... \(\$ 55.00\).
(18) WORD-STAR.....The ultimate word processor.....a menu driven word processing system that can be used with any printer. All standard word processing commands are included.....plus many unique commands only found on WORD STAR.....requires CP/M..... \$495.
(19) MAIL LIST MERGE....An add on package that allows the user to send form letters (created on WORD-STAR) to any compiled mailing list (using any CP/M based MAIL program such as the PEACHTREE MAIL PROGRAM).....requires CP/M, WORD STAR and any CP/M based mail program..... \(\$ 150\).
(20) EDITOR ASSEMBLER from Galactic Software Ltd. is the first user oriented Editor Assembler for the MODEL II and was designed to utilize all the features of the MODEL II. It includes innovative features for ease of coding and debugging and complete documentation (over 120 pages) .....works under TRSDOS..... \(\$ 229\).
(21) MAIL/FILE SYSTEM from Galactic Software Ltd. stores 2,500 names per disk. No sorting time is required since the file is automatically sorted by first and last name plus Zip Code on input. Retrieve by any combination of 19 user codes. Supports an 11 digit alphanumerica Zip. Supports a message line. Comes complete with user-oriented documentation (100-page manual). Allows for company name and individual of a company and complete phone number (and extensions).....works under TRSDOS.....\$199.

\title{
This nifty program screen displays your active variable and runs as a USR function to boot!
}

\section*{Variable Scroll}

William L. Colsher 4328 Nutmeg Lane, Apt. 111 Lisle, IL 60532

1f you have ever tried to develop a long BASIC program on a TRS-80, you have probably wondered at some point exactly what variable names you have already used. Even if you are fortunate enough to have a printer, it is often hard to be sure that a new variable is really new.

There are at least two ways around this problem. The simplest is to keep a list of the variables as you use them. Unfortunately, that requires more foresight than most of us use. Besides, that piece of paper can get lost all too easily.

The other solution is a program that displays the currently active variables on the screen any time. That program is the topic of this article.

\section*{Variable Locations}

To begin, you need to know where (Table 1) and how (Table
2) BASIC stores its variables.

I decided to make this program a USR function.

Using it is quite simple. If you take a look at the BASIC Reference Manual, you'll find that in order to use the USR function, you have to POKE a couple of bytes in one of the reserved areas with the address of the USR routine.

This is ordinarily the case, but an assembler is a wonderful thing, especially one with an ORG statement. The first ORG in the program uses the address of the place we would have had to POKE. The next statement, a DEFW that contains the starting address of the program, is assembled at that location. (If you want to assemble this program at a different location, remember to change both the DEFW and the second ORG.)

Since the POKE is taken care of, all you have to do is protect an area of memory for the program by entering 32500 in response to "MEMORY SIZE?", loading the program with the SYSTEM command and returning to BASIC. Table 3 shows you
\begin{tabular}{ll} 
Location & Contents \\
16633 & The address of the start of the scalar area \\
16635 & The address of the start of the array area \\
16637 & The address of the start of free memory
\end{tabular}

Table 1: Part of the BASIC Reserved Area. All the areas are contiguous. Thus, the start of the second is also the end of the first, etc.
how.
You can test the program now by DIMensioning a couple of variables in the immediate mode and assigning values to a couple of scalars. Invoke the DISP routine by typing PRINT USR(0) or \(\mathrm{X}=\mathrm{USR}(0)\). ( X is only an exam.
ple, any variable name can be used.)

The screen should clear and you will get a display of your scalars on one line or more: there are sixteen variables per line. Below that are the arrays.

A couple of improvements

All variables are stored in essentially the same manner. The first three bytes always store the same information:

(Type may be one of the following: 2-Integer, 3-String, 4-Single Precision, 8-Double Precision.)
If a variable has a single character name, a zero is placed in the other location After these three bytes, scalars have the following form:

(Variables are top to bottom: Integer, Single Precision, Double Precision, String.) Following is the format of the array storage area. The first three bytes are the same as for scalars. This is followed by:

This is foliowed by pairs of bytes containing the dimension sizes. This is in turn followed by the actual values.

Table 2: Structure of BASIC Variable Storage.

\section*{INCOME TAX SYSTEM FOR TRS-80* MODEL I OR II}

Our system, which prepared 500,0001979 returns, features the following:
1. Full interactive user control, in tax-form language only, line-by-line.
2. Screen display of full 1040 and all schedules, prior to printout.
3. Change of a single amount item automatically changes and re-computes entire return.
4. All printout formats IRS and state approved.
5. Stores Preparer's Identification for automatic printing at bottom of page 2.
6. Built-in Validation Check tests entire system, hardware and software.
7. Special Printer Adjustment routines, Line Length, etc.
8. Selection of closed or open output formats-for standard Form 1040 or open name-box types.
9. Software control of text position on page. Makes forms-alignment simple. Permits use with non-adjustable printers.
10. Fills in pre-printed Forms or you can use overlays. Your choice.
11. Automatically computes: Tax - SDI Overpayment - Wages Total from W-2's Earned Income Credit - Income Averaging - Maximum/Minimum Tax - Least Tax Method - All Percentage of Income Limitations - All Fixed Limitations - many, many more.
12. Full support through the tax season - no charge.
13. Inexpensive yearly updates in accordance with tax-law changes.
14. Modular construction - lets you order only the type and size system you need.

> PRICING STARTS AT \(\$ 189.95\) (1040 \& SCHEDULE A) 25-PAGE DESCRIPTIVE MANUAL \(\$ 7.50\) (Refunded on Order) MINIMUM SYSTEM REQUIRED: MODEL I, 32K, 1 DISK DRIVE
> •TRS-80 IS A TRADEMARK OF TANDY CORP.

come to mind after using this program for a littie while．The variables are displayed in the order they were used．Scalars come before arrays，but that＇s built into the program．

It might be wise to sort the variables，so that when working with a large program it is easier to check a new variable name．A second but more difficult en－ hancement might add a cross－ reference generator．This would display not only the variables， but also the line numbers in which each is used．

\title{
PROGRAMMING TOOLS FOR YOUR TRS-80
}

\section*{INSIDE LEVEL II}

The Programmers Guide to the TRS-80 ROMS
INSIDE LEVEL Il is a comprehensive reference guide to the Level II ROMs which allows the machine language or Basic programmer to easily utilize the sophisticated routines they contain. Concisely explains set-ups, calling sequences, and variable passage for number conversion, arithmetic operations, and mathematical functions, as well as keyboard, tape, and video routines. Part Il presents an entirely new composite program structure which loads under the SYSTEM command and executes in both Basic and machine code with the speed and efficiency of a compiler. In addition, the 18 chapters include a large body of other information useful to the programmer including tape formats, RAM useage, relocation of Basic programs, USR call expansion, creating SYSTEM tapes of your own programs, interfacing of Basic variables directly with machine code, a method of greatly increasing the speed at which data elements are stored on tape, and special precautions for disk systems. INSIDE LEVEL II is a clearly organized reference manual. It is fully typeset and packed with nothing but useful information. It does not contain questions and answers, ROM dumps, or cartoons. INSIDE LEVEL II..... \(\mathbf{1 5 . 9 5}\)

\section*{TELECOMMUNICATIONS PROGRAM}

This program allows reliable high speed file transfers between two disk-based computers over modems or direct wire. It is menu driven and extremely simple to use. Functions include real-time terminal mode, save RAM buffer on disk, transmit disk file, receive binary files, examine and modity UART parameters, program 8 custom log-on messages, automatic 16 -bit checksum verification of accurate transmission and reception, and many more user conveniences. Supports line printers and lowercase characters. With this program you will no longer need to convert machine language programs to ASCII for transmission, and you will know immediately if the transmission was accurate. TELCOM..... \(\mathbf{\$ 2 9 . 9 5}\)

\section*{PROGRAM INDEX FOR DISK BASIC}

Assemble an alphabetized index of your entire program library from disk directories. Program names and free space are read automatically (need not be typed in) and may be alphabetized with a fast Shell/Metzner sort by disk or program. The list may also be searched for any disk, program, or extension; disks or programs added or deleted; and the whole list or any part sent to the printer. Finally, the list itself may be stored on disk for future access and update. "The best thing since sliced bread" (January issue of '80 Microcomputing). One drive and 32K required. INDEX......\$19.95

\section*{SINGLE STEP THROUGH RAM OR ROM}

STEP80 allows you to step through any Basic or machine language program one instruction at a time, and see the address, hexadecimal value, Zilog mnemonic, register contents, and step count for each instruction. The top 14 lines of the video screen are left unaltered so that the "target program" may perform its display functions unobstructed. STEP80 will follow program flow right into the ROMs, and is an invaluable aid in learning how the ROM routines function. Commands include step (trace), disassemble, run in step mode at variable step rate, display or alter memory or CPU registers, jump to memory location, execute a CALL, set breakpoints in RAM or ROM, and relocate to any page in RAM. The display may also be routed to your line printer through the device control block so custom print drivers are automatically supported. STEP80..... \(\$ 16.95\)

4 SPEED OPTIONS FOR YOUR TRS-80!
The SK-2 is the most versatile clock modification available for the TRS-80. Speeds may be switched between normal, an increase of \(\mathbf{5 0 \%}\), or a \(50 \%\) reduction; selectable at any time without interrupting execution or crashing the program. Instructions are also given for a \(100 \%\) increase to 3.54 MHz , though the TRS-80 is not reliable at this speed. The SK-2 may be configured by the user to change speed with a toggle switch or on software command. It will automatically return to normal speed any time a disk is active, requires no change to the operating system, and has provisions for adding an LED to indicate when the computer is not at normal speed. It mounts inside the keyboard unit with only 4 necessary connections for the switch option (switch not included), and is easily removed if the computer ever needs service. The SK-2 comes fully assembled with socketed IC's and illustrated instructions. SK-2.....\$24.95

\section*{RAM SPOOLER AND PRINT FORMATTER}

This program is a full feature print formatting package featuring user defineable line and page length (with line feeds inserted between words or after punctuation), screen dump, and printer pause control. The serial version allows baud rate selection from the keyboard. In addition, printing is done from a 4 K expandable buffer area so that the LPRINT or LLIST command returns control to the user while printing is being done. Ideal for Selectric or other slow printers. Allows printing and processing to run concurrently. Please specity PARALLEL or SERIAL (RS-232 interface) version. SPOOLER..... \(\$ 16.95\)

\section*{DUPLICATE SYSTEM TAPES WITH CLONE} Make duplicate copies of ANY tape written for Level II. They may be SYSTEM tapes (continuous or not) or data lists. The file name, load address, entry point, and every byte (in ASCII format) are displayed on the video screen. CLONE..... \(\mathbf{\$ 1 6 . 9 5}\)

\section*{MACHINE CODE FAST FOURIER TRANSFORM}

This complete package includes 3 versions of the machine language FFTASM routine assembled for 16,32 , and 48 K machines, a short sample Basic program to access them, a 10K Basic program which includes sophisticated interactive graphing and data manipulation, and a manual of instructions and examples. The machine language subroutines use variables defined by a supporting Basic program to make data entry and retrieval extremely fast and easy for custom implementation. They perform 20 to 40 times faster than their Basic equivalent ( 256 points in 12.5 seconds), and require less than 1550 bytes of memory. FFTASM.....49.95

\section*{FOR THE MODEL II}

\section*{LYNC \\ from Midnight Sottware}

High level data communication for the Model II with CP/M. LYNC will send and receive any file with automatic error checking and retries. Either end may initiate file transfers, and multiple files may be sent with wildcard filenames. Remote or local directories may be called from within the program. Allows full protocol, nonprotocol, and real-time conversation modes. May be used over phone lines at 300 baud or direct to another computer at up to 9600 baud. Also available for other CP/M computers. LYNC..... \(\mathbf{\$ 9 5 . 0 0}\)

\title{
Frustrated by the limitations of INPUT command? Read this.
}

\section*{Input with Insight}

\author{
Jack Decker \\ 1804 West 18th Street, Lot 155 Sault Ste. Marie, MI 49783
}

Most TRS-80 users have been frustrated by the limitations of the INPUT command in BASIC.
The command won't accept commas in the input string unless quotation marks are also used, and it won't select an ap. propriate prompt character in place of the question mark. (How many times have you seen PRESS ENTER TO CONTINUE? in a program?) It also has difficulty formatting the input on the screen, since hitting the enter key always advances the cursor to the beginning of the next line.

\section*{Construct a String}

The solution is to construct a string using the INKEY\$ function. The subroutine in Listing 1 does just this. It's the shortest subroutine l've found that will overcome the limitations, and yet behave like an INPUT command in regard to the use of the backspace and shifted back. space keys.
No automatic line feed is needed after the enter key is pressed, but if you want one you can insert a PRINT: statement just before the RETURN. In the
interest of conserving memory line 60010 is heavily packed.

To use the subroutine in place of an INPUT statement, simply GOSUB 60000 . On return, string variable B will contain the input. You use variable \(\mathbf{A} \$\) within the subroutine to hold individual keyboard strokes as they are entered. No other variables are used in this routine.
For those who may wish to customize this routine for their own applications, here is a brief explanation of what is happening in the subroutine:

In line 60000, B\$ is set to the null string (a string variable with no characters in it). PRINT CHRS(14); turns on the cursor.

Lines 60010 and 60020 form a loop. When the program falls through from line 60010, line 60020 catches it and sends it right back where it came from.
Line 60010 first tests to see that a character has been input. If one has (A\$>"'"), it then tests to see if that character was the enter key. If so, it turns off the cursor (PRINT CHR\$(15);) and returns.

If the character was not the enter key, it is tested to see that it is not a control character (IF A\$>CHR\$(31)). This is to keep anyone from lousing up the whole screen display by accidentally hitting the wrong key.

Assuming the character passes this test, you test the string
variable to make sure it would not contain over 255 characters if this character were added to it (LEN(B\$)<255); this causes an LS ERROR.

Here is your opportunity to limit the length of the input. If, for example, you want to prevent any input over 40 characters long, change the 255 to 40 . You could even change the 255 to a numeric variable, such as \(X\), and
then use a statement of the form: \(X=40\) :GOSUB 60000 .
Varying the value of \(X\) allows a different maximum line length each time the subroutine is called.

\section*{Character Input}

Going back to the character that was input, assume that it has an ASCII value greater than 31 and will not cause B\$ to ex-
\(6000 \mathrm{~B} \$ \mathrm{Enn}^{\mathbf{n}}\) :PRINTCHR\$(14);
60010 A \(=\) INKEY \(:\) IFA \(\$>^{\prime \prime \prime}\) IFAS=CHR \(\$(13)\) THENPRINTCHR \(\$(15) ;\) : RETURNELSEIFAS>CHR\$ (31)ANDLEN (B\$) <255THENPRINTAS; : B \(\$=\mathrm{BS}\) +ASELSEIFB\$>"n IFAS=CHR (8) THENPRINTAS; : B \(=\) LEFT (BS,LEN (

}

Program Listing 3.
ceed maximum length if added to it. The character is then added to \(\mathrm{B} \$\) and printed on the screen.

Suppose it fails these tests? You still want to check for a valid backspace or shifted backspace code. But first you must test string variable \(\mathrm{B} \$\) to make sure that it has one or more characters in it.

If \(\mathrm{B} \$\) does indeed contain one or more characters, the routine tests to see if \(A \$\) is a backspace: (IF A\$ \(=\mathbf{C H R S ( 8 )}\) ). If so, it prints it on the screen and deletes one character from B : \((\mathrm{B} \$=\) LEFT\$(B\$,LEN(B\$)-1.

If \(A \$\) is a shifted backspace: (IF \(A \$=C H R \$(24)\) ), then as
many backspace characters are printed as there are characters in \(B \$\), and \(B \$\) is set to the null string. Should the input character fail all tests, it is ignored.

If you prefer a blinking cursor, you can have that and still have only three lines in your subroutine. Listing 2 shows how. Line 60010 is very packed, but you save much space.

Variables \(X\) and \(Z\) are used in this subroutine, along with \(A \$\) and \(B \$\). \(X\) controls the rate of blink. \(Z\) will always equal either zero or -1 , since NOT \(0=-1\) and NOT \(-1=0\). This means that \(\mathrm{CHR} \$(15+Z)\) is always either CHR\$(14), which turns on the cursor, or CHR\$(15), which
turns it off.

\section*{Using the Subroutine}

Listing 3 shows one way to use this subroutine. Try typing this along with the subroutine of your choice. Experiment with it awhile, and then try replacing the 255 in line 60010 with variable Y. Note that you cannot enter more characters than the proper amount.

Entries for city, state and zip code are all on the same line of the video display. One type of error handling is shown in line 60; if the zip code entered is less than five characters, the program deletes the errant entry and forces you to reenter. Of
course, you would want a more sophisticated error-checking routine in any serious program, but this demonstration program does show the capabilities of this subroutine.

One thing must be said about this subroutine-it violates all rules of stylish BASIC. If you like nice neat listings, then this subroutine is not for you.

For this I make no apologies, since I don't know of any way to make this routine list neatly without using a lot more memory. Part of its virtue is that it's short, making heavy use of the IF . . THEN . . ELSE syntax, and any attempt to make it more stylish destroys that virtue. -

All you need to read/write on both sides of a minifloppy is a paper punch and guts.
}

\title{
Punch Out Your Disks
}

\author{
Richard Taylor \\ 100 Manhattan Ave. 1809 \\ Union City, NJ 07087
}

For the price of a standard paper punch you can double your present disk storage. Just follow the simple steps detailed in this article and you can be reading and writing on both sides of your disks. I have punched-out over 100 disks and only two of them have had defective second sides.

To get started you will need a pencil, a paper punch that catches its own punches, a tracing of a disk and a smooth piece of paper. The tracing of the disk (which we shall call the 'templet') can be made by Xeroxing a disk, cutting apart an unusable disk, or by making a tracing.

Try to use a stiff piece of
paper or glue the copy to a piece of cardboard. Cut out the center hole, the oblong area below it, the write protect notch on the upper right edge and the small hole near the center hole. The smooth piece of paper can be the backing from a peel-away label or something similar. The templet shown in the photographs was made from a Xerox. It happens to have two holes punched. This is just a convenience and is not needed to do the job.

\section*{The Second Hole}

The only thing that prevents a Radio Shack disk drive from writing to the second side of your disks is that it needs a second small hole near the center so that it can find the sectors correctly. If you rotate your disk in its sleeve and watch the small hole, you will see an even smaller hole right in the disk. Soft
sectored disks have only one of these and the disk drive uses a light to "see" when this tiny hole passes by.
Our job is to punch a second hole in the sleeve so that when the disk is flipped over it will have a hole that allows the drive to see the tiny hole in the disk. The placement of the second hole does not have to be perfect. As long as the tiny hole can be seen through the new holes in the sleeve, everything will run correctly.
STEP 1: With the label of the disk in the upper left hand corner, place the templet on the disk so that the small hole is positioned by the lower left side of the center hole. Line up all reference points. Using a pencil, trace the new small hole on the disk. Also trace the notch on the upper left edge (Photo 2).
STEP 2: Take the strip of smooth paper and insert it be-
tween the sleeve and the disk (Photo 3).

STEP 3: Using your thumb, make room for the punch by lifting the sleeve near the center hole (Photo 4).

STEP 4: Insert the punch and line it up with the traced hole. Punch the hole (Photo 5).

STEP 5: Insert your finger where the punch was and check to see if the linear has been completely removed. In most cases it will not be. With your finger, push it up through the hole and tear it off (Photo 6).

STEP 6: Repeat steps 1 through 5 on the second side of the disk.

STEP 7: Punch the new notch near the bottom of the label. (Photo 7).

That's all there is to it. Photo 8 shows you what your new disk should look like. Labels can be placed in the upper left corner with no problems. Any problems

\title{
SNAPP, INC. \\ Number I in software for the Model II
}

MODEL II EXTENDED BASIC
A family of enhancements to the Model II BASIC interpreter. Part of the package originated with the best of APPARAT, INC.'s thoughts in implementing NEWDOS BASIC. The system is written entirely in machine language for SUPER FAST execution. The extensions are fully integrated into Model II BASIC, and require NO user memory, and NO user disk space. The package is made up of the following five modules, each of which may be purchased separately:
XBASIC - Six single keystroke commands to list the first, last, previous, next, or current program line, or to edit the current line. Ten single character abbreviations for frequently used commands: AUTO, CLS, DELETE, EDIT. KILL, LIST, MERGE, NEW, LLIST, and SYSTEM.
\$25
XREF - A powerful cross-reference facility with output to display and/or printer. Trace a variable through the code. Determine easily if a variable is in use.
\(\$ 40\)
XDUMP - Permits the programmer to display and/or print the value of any or all program variables. Identifies the variable type for all variables. Each element of any array is listed separately.
\(\$ 40\).
XRENUM - An enhanced program line renumbering facility which allows specification of an upper limit of the block of lines to be renumbered, supports relocation of renumbered blocks of code, and supports duplication of blocks of code.
\(\$ 40\)
XFIND - Permits quick and easy location of specified strings or keywords within the program text.
\(\$ 30\)
SAVE - on the purchase of the entire package.
SKRUNCH
\$140
A SUPER FAST TRSDOS UTILITY. Compresses your BASIC programs to an absolute minimum. Typically saves \(\mathbf{3 0 - 4 0 \%}\) space, even for programs without REM statements! Also results in \(\mathbf{7 - 1 0 \%}\) improvement in execution speed.

\section*{FRIEND}

FOUR NEW TRSDOS COMMANDSI
SHOW - A much better multi-disk directory display. Let's you see only those files you want, and includes date of last update
MOVE - A much better file copying command. Copy/Move whole groups of files, renaming them at the same time, it desired, with just 1 command!
ERASE - Better than KILL. better than PURGE.
PRINT - Print BASIC programs from disk. whether saved in ASCII or compressed.
All 4 DOS commands allow fast processing of one, or complete groups of files, based on generic naming and wild card specifications. Enhanced functions too numerous to fully describe here.
EXAMPLES:
SHOW PAY•/BAS:
Directory display of all '/BAS' files on all diskettes which begin with 'PAY.
MOVE PAY•/BAS: 1 TO \(=/\) OLD 3
Save current versions of payroll programs to drive 3, changing extension to \%OLD MOVE OLD \(\%\) TO NEW \(=/=1\)

Copy all files on drive 0 which begin with OLD, regardless of extension, to drive 1. changing the first 3 letters of the filename to 'NEW,' but retaining the same file extension Save time!
Reduce frustration!
Eliminate ERROR 33!
SPOOLER - Model I and Model II Our workhorse! This package, available for Model I, in the TRSDOS/NEWDOS or NEWDOS 80 versions, or for the Model II. greatly enhances system performance when running typical business applications. Many applications have been benchmarked to run nearly TWICE AS FAST with the SPOOLER installed. Installs in minutes, and no changes are required to your programs. Preferred Model II versions require NO user memory. Optional features for the Model II version only Serial printer support, and DISK SPOOLING support. The DISK SPOOLING support is particularly recommended for word processing applications.

SERIAL PRINTER OPTION \$50
DISK SPOOLING OPTION \$50

\section*{ITOII}

A helping hand when converting BASIC programs from the Model I to the Model II. Automatically adjusts PRINT @, and PRINT USING to compensate for differences in the language. Advises you where adjustments are necessary for PEEK. POKE, etc. \$25

\section*{BUGZAP}

A powerful utility oriented toward the machine language programmer. Display/Modify/Print/ Memory/Disk sectors. Use this to help you learn more about the internals of the Model II.

\title{
Interfacing the NEC Spinwriter
}

\section*{James D. Kunzman} 2221B Pennsylvania Avenue Homestead AFB, FL 33039

Have you ever purchased a major peripheral for your TRS-80 microcomputer only to find that no interface information was provided?

This happened to me when I purchased my NEC Spinwriter.

After a fruitless call to the distributor, I was referred to an NEC Field Engineer who provided wiring instructions for running at 300 baud. He also sug. gested that I buy a \(\$ 3.00\) Product Description Manual explaining the wiring requirements. This manual clearly states the interface requirements for the RS-232-C port. If I had received it with the printer, I could have saved hours of grief.
While trying to connect this printer, I have discovered a simple technique to operate it at 1200 baud.

\section*{Hardware Problems}

Using the NEC field engineer's instructions and the soft-
ware driver published in Radio Shack's RS-232-C manual, the printer soon came to life-at least for a while.
I wired the Spinwriter according to the diagram in Fig. 1, minus the connection from pin 6
solve the problem.
After a week, however, it failed again, so I returned it to Radio Shack. Finally, after failing a third time, I took the board to the repair center myself to confront the repairman. We de-
> "After failing a third time I took the board. . .to confront the repairman."
to pin 19, which is not required at 300 baud.

Suddenly the printer started printing garbage and made sporadic carriage movements. Eventually, it stopped printing completely.

Convinced that the printer was not at fault, I sent the expansion interface and RS-232-C to the Radio Shack repair center. The repair center merely reseated the RS-232-C board in the interface. This appeared to
termined that the RS-232-C board was warping from heat, which caused it to fail.

Since my board was slightly warped, the repair center cheerfully replaced the defective RS-232-C board with a new one. The baud rate generator runs rather warmly, so to keep this replacement board from warping I drilled \(3 / 8\)-inch holes in the RS-232-C compartment door for ventilation. To further reduce heat problems I also removed
the power packs from the expansion interface, cut off their cases and mounted them with appropriate fuses and switches in a small aluminum minibox.

Everything worked fine until the repair warranty period expired, then the same problems started again.

I was about to break the inviolate Radio Shack seal, when I noticed that the expansion interface printed circuit (PC) board was badly warped. This was pulling the center of the RS-232C connector down and causing the board to lose contact. Voila!

I tried a little "brogan maintenance." I pried the RS-232-C edge card connector with a screwdriver to get it seated against the board. This seemed to do the trick, and although the problem recurs every month or two, it reseats easily.

\section*{Software Problems}

Hardware problems were not my only obstacles in getting the Spinwriter to run. I also had numerous software problems, especially when I tried to step up beyond 300 baud.

I was about to write a software driver patch for both the

\section*{At Last!}

A TRS-80'm MUSIC SYNTHESIS SYSTEM
WRITTEN BY JON BOKELMAN

\section*{Turns Any 16K Level II TRS-80 Into A High Quality Musical Instrument}

\section*{Itge Software}

A five part machine language program consisting of:

1Digital synthesizer - produces up to four simultaneous voices in a six-octave range. For example, you could have a trumpet, oboe, clarinet, and organ playing in four-part harmony or alter any of the voices to imitate other instruments.

2Music language complier-a simple and easy to use language allows you to enter your favorite written music in any key or time signature. Plays all note values from whole notes to sixty-fourth notes which may be single, double, or triple-dotted and/or played as triplets. Supports single and double accidentals, stacatto, pizicatto, two forms of articulation, repeats, second endings (with or without retard), and modulation.
2 Full screen editor-a full function text editor with blinking cursor is provided for easy entering and modifying of music programs. Functions include insert/delete characters, insert/delete line and global character string search, and automatic error detection/display. File manager - provides the orderly storing and retrieval of named program files on tape or disk. You can even sequence several songs for automatic loading and playing.

5Initialization-this set-up routine allows you to alter the voices, select the standard four-voice synthesizer or a special high resolution, three-voice version and choose the standard ( 1.77 MHz ) or the enhanced ( 2.66 MHz ) clock rate.

\section*{Ihe Hardware-}

A single \(11 / 2^{\prime \prime}\) by \(2^{\prime \prime}\) PC board plugs into the expansion connector on the TRS-80 keyboard or the screen printer connector on the expansion interface. This board contains the electronics required to convert the computer output into a high fidelity audio signal. Just plug in the board and connect to the aux/tape/tuner input of any audio amplifier. No external power supply is required.

\section*{Includes:}
- Tape and disk versions on cassette
- Completely assembled and tested PC board
- Detailed and complete instruction manual
- Sample music programs

SPECIAL DEMO LINE! HEAR ORCHESTRA-80 ON (408)727-8194
"TRS-80 IS A TRADEMARK OF TANDY CORPORATION

Electric Pencil and the KVP software driver I had purchased, when I decided to take a look at the Radio Shack RS-232-C driver software.
When I read the description of the driver routine in Radio Shack's manual, it mentioned that the software tests the DATA SET READY (DSR) for a low and loops each time if not. This is definitely not true, as you can see if you examine the listing of the driver on pages 27-28. The driver does test the UART status. It must in order to avoid losing characters.
While trying to find a way to patch all three of my printer driver routines-KVP, Electric Pencil and Radio Shack's - I realized that I could test both the

Figure 1.

UART and the printer status line at the same time. In other words, if either line is active, then the driver routine does not transmit.

After disassembling the driver routines for all three software drivers, I found that each routine tests the UART status in exactly the same way.

\section*{Success at 1200 Baud}

At this point, I abandoned my attempts to patch each piece of software and started to concentrate on modifying my RS-232-C board to tie a printer status line with the UART status line. The modifications I made are shown in Figs. 1 and 2.

I connected the printer status line (Spinwriter pin 19) to the DSR line (pin 6) from the RS-232. C board. The printer status line is inverted and changed from RS-232-C leveis to TTL levels by U3. The Spinwriter printer Reverse Channel line (line 19) was used as the printer status line. This line can be set to go either high or low when any of the following occur:
1. Buffer \(7 / 8\) Full
2. Paper Out
3. Ribbon End
4. Check Condition
5. Cover Open
6. Parity/Framing Error

With the Reverse Channel line set to go high when any of the above occur, pin 11 of U3 can be tied directly to the UART status line (pin 22 of U6 or pin 4 of U5). Although a piece of wire can be used for this connection, I used a small switching diode, a 1 N914, which cost all of 11 cents. The anode should be connected to U3 pin 11. I used a small piece of wire wrap to connect the cathode to U5 pin 4.

With this simple modification, the printer driver routines
test data line 6 for a logic 1 , and if either the UART is busy or the printer status line is high, the printer driver stays in a loop. Essentially, both lines are ORed together.

I now run my NEC Spinwriter at 1200 baud. The print speed is more than double the 300 baud speed, because the internal logic of the NEC can process multiple spaces extremely fast. When multiple spaces are encountered, the print head moves directly to the next printable character, as soon as it is received from the serial line. Overall throughput is dramatically increased.

Figure 2.

\section*{BRIZZE BOXING}

It'S you against Bruiser in the fight of the century! YOU CONTROL ONE BOXER ON THE SCREEN AND YOUR TRS \(80^{*}\) CONTROLS BRUISER. BUT WATCH OUT! BRUISER GETS BETTER AS THE FIGHT PROGRESSES AND YOU MAY GET KNOCKED OUT! WITH SOUND EFFECTS.

\section*{FROM THE LEADER IN UTILITY SOFTWARE FOR THE TRS* COMPUTERS}
* \(\star\) NEW * * HARDISOFT DISK SYSTEM (MOD II) \$400

The Hard Disk Software Implementation You Have Been Waiting For!! MOD II TRSDOS compatible using Cameo controller interface to popular large hard disk fixed/removable combinations (Ampex, CDC, Diablo, Pertec, Wanco, etc.). Compatible with your existing programs - change only 'filename'. All disk BASIC statements identical. Improved dynamic file allocation. A single file can be as large as one disk 20 megabytes or larger. Alternate mode allows 24 -million byte record range. Directory expandable to handle thousands of files! Includes special XCOPY, DCS, and SZAP utilities for use with hard or soft disks. Parameterized FORMAT utility includes options for specifying the number of sectors/track, platters/drive, sectors/granule, sectors/directory, etc.
\(\star\) * NEW \(\star\) * BASIC LINK FACILITY 'BLINK' (Mod I Min 32K 1-disk) \(\mathbf{\$ 2 5}\) Mod I, \(\$ 50\) Mod II
Link from one BASIC program to another saving all variables! The new program can be smaller or larger than the original program in memory. The chained program may either replace the original program, or can be merged by statement number. The statement number where the chained program execution is to begin may be specified!

\section*{INFINITE BASIC \(\$ 49.95\) (Mod I Tape or Disk)}

Extends Level II BASIC with complete MATRIX functions and 50 more string functions. Includes RACET machine language sorts! Sort 1000 elements in 9 seconds!! Select only functions you want to optimize memory usage.
INFINITE BUSINESS \(\mathbf{\$ 2 9 . 9 5}\) (Requires Infinite BASIC)
Complete printer pagination controls - auto headers, footers, page numbers. Packed decimal arithmetic 127 digit accuracy \(+,-, *, I\). Binary search of sorted and unsorted arrays. Hash codes.
COMPROC \(\$ 19.95\) (Mod I - Disk only)
Command Processor. Auto your disk to perform any sequence of instructions that you can give from the keyboard. DIR, FREE, pause, wait for user input, BASIC, No. of FILES and MEM SIZE, RUN program, respond to input statements, BREAK, return to DOS, etc. Includes lowercase driver software, debounce and screenprint!
GSF \(\quad \mathbf{\$ 2 4 . 9 5}\) Mod I, \(\mathbf{\$ 5 0 . 0 0}\) Mod II (Mod I Tape or Disk - Specify Memory Size)
Generalized Subroutine Facilities. The STANDARD against which all other sorts are compared! Machine language - fast and powerful! Multi-key multi-variable and multi-key character string. Zero and move arrays. Mod II includes USR PEEKS and POKES. Includes sample programs.
DSM \(\quad \mathbf{7 5 . 0 0}\) Mod I, \(\mathbf{\$ 1 5 0 . 0 0}\) Mod II. (Mod I Min 32K 2 -drive system. Mod II 64K 1-drive)
Disk Sort/Merge for RANDOM files. All machine language stand-alone package for sorting speed. Establish sort specification in simple BASIC command File. Execute from DOS. Only operator action to sort is to change diskettes when requested! Handles multiple diskette files! Super fast sort times - improved disk I/O times make this the fastest Disk Sort/Merge available on Mod I or Mod II.
UTILITY PACKAGE \(\mathbf{\$ 1 5 0 . 0 0}\) (Mod II 64K)
Important enhancements to the Mod II. The file recovery capabilities alone will pay for the package in even one application! Fully documented in 124 page manual! XHIT, XGAT, XCOPY and SUPERZAP are used to reconstruct or recover data from bad diskettes! XCOPY provides multi-file copies, 'wild-card' mask select, absolute sector mode and other features. SUPERZAP allows examine/change any sector on diskette including track- 0 , and absolute disk backup/copy with I/O recovery. DCS builds consolidated directories from multiple diskettes into a single display or listing sorted by disk name or file name plus more. Change Disk ID with DISKID. XCREATE preallocates files and sets 'LOF' to end to speed disk accesses. DEBUGII adds single step, trace, subroutine calling, program looping, dynamic disassembly and more!!
BASIC CROSS REFERENCE UTILITY \(\mathbf{\$ 5 0 . 0 0}\) (Mod II 64K)
SEEK and FIND functions for Variables, Line Numbers, Strings, Keywords. 'All' options available for line numbers and variables. Load from BASIC - Call with 'CTRL'R. Output to screen or printer!
DEVELOPMENT PACKAGE \(\$ 125.00\) (Mod II 64K)
Includes RACET machine language SUPERZAP, Apparat Disassembler, and Model II interface to the Microsoft 'Editor Assembler Plus' software package including uploading services and patches for Disk I/O. Purchase price includes complete copy of Editor Assembler + and documentation for Mod I. Assemble directly into memory, MACRO facility, save all or portions of source to disk, dynamic debug facility (ZBUG), extended editor commands.

\title{
A pioneering simulation of the trek to Fort Stinkendosert.
}

\section*{Westward Ho!}

Raymond J. Herold 8363 Shady Grove Circle Manassas, VA 22110

Westward, Ho! simulates the westward trek by the earliest, and possibly the bravest, of the pioneers. The program does not reflect any particular journey or trail, but rather a composite of all the varied dangers and situations the pioneers faced.

To give the program a competitive flavor, up to four pioneers can play at one time. They engage in a race to see who can reach their destination first, assuming anyone survives! A single player attempts to make the journey in the fewest number of days. The journey is not easy, and many decisions you make early on affect your success.

When the game begins, you are asked to enter the number of players and the name of each.

\section*{Choosing your Supplies}

Each player picks the supplies he wants to take on the journey. You face the same dilemma as the pioneers: What do you take into the unknown? You want to be prepared for any situation, yet each additional item adds weight to the wagon. The
more weight the horses must pull, the less distance you go each day.

The longer you are in the wilderness, the greater the odds of meeting a tragic end. Since you only have the opportunity to select supplies once, choose carefully! Keep in mind that the total weight you carry decreases as you consume food and water. Each player starts with a team of four horses.

At the beginning of each player's turn, a map is drawn detailing the area he must cover to reach his destination. Different graphics characters are used to symbolize deserts, forests and mountains. The remaining areas are prairies. Your starting point (in the East) and destination (in the West) are shown, along with an indicator showing your current location.
When the map is drawn, approximately 6.7 seconds elapse before locations are printed. The computer uses this time to figure out where you are, so be patient.
Use the map as an aid in selecting the route you wish to follow. There are advantages and disadvantages to any direction you may choose. You use more water in the desert, but it is a more direct route. If you go through the forests, food and water aren't as critical, but you must cover more ground. When you reach the mountains, you must find a pass in order to trav-
el across them. If you are lucky, you may stumble across a water hole or stream, or even a lone settler who may help, but don't count on it! And, of course, there is danger everywhere.

After you have examined your map, you get a status report. This tells you where you are, how far you have traveled, how much water and food you have and your condition and that of the horses. Your condition and the condition of the horses falls into two categories.

First of all, if you or the horses are hungry, thirsty, wounded or sick, this will obviously affect how far you can travel. Secondly, if you are seriously sick or wounded, say, mauled by a bear, you certainly wouldn't be able to travel at all. In this instance you may lose several days of travel while you recuperate.

\section*{Scouting the Area}

You have the option of scouting the area and finding out what is to the north, south, east

\section*{SOFTWARE \(\rightarrow\) TRS-80-SOFTWARE}

PACKAGE ONE INCLUDES: GRAPHIC. TREK "2000" - This full graphics, real Exploding photon torpedoes and phasers fill the screen! you must actually navigate the enterprise to dock with the giant space stations as well as to avoid klingon
torpedoes! mas shields, galactic memory readout. damage reports. iong range 'eadout, etc! Has 3 leports, ior beginning
sensors,

WOARG, Time: 3099 , Piace: Earth's Solar WohG- Time: 3099, Place: Earth's Solat
System Mission: As general of Earth's forces, your job is to stop the Worg Invasion and destroy their outposts on Mars, Venus, Saturn, Neptune, etc' Earth's
Forces: Androids
Space Fighters Lazer Cannon - Neutrino Blasters! Worg Forces: Robots - Saucers - Disintegrators Pioton Destroyers! Multi tevel game lets you advance to a more complicated game
As you get bettert STAR WARS
Man Manuever your space lighter deep into the nucteus of the Death Star Diop Your
bomb, then escape via the onty exit. This oomb, then escape via the onty exit. This oe with you! ESPACE TARGET Shoot at enemy Snips with your missules.
it they eject in a parachute, capture them of it you're cruel, destroy them! \(F\) ull This fast action graphics game SAUCERS umit! Can you be the commander a time umit! Can you be the commander to win
the distinquished cross! Requires split
second timing to win! Watch out!

ONLY 14.95

PACKAGE FIVE INCLUDES: SUPER HORSERACE - Make your bets fust tike at the real racetrackt 8 horses race in this people can play: Uses real oads but has that eiement of chance you see in real life! Keeps track of everyone's winnings and tosses. This is one of the few computer sumulations that can actually get a room of
Deople cheering! people cheering! *MAZE MOUSE-The mouse with a mind! of whatever size you specity, then searches tor a way out! The second time, he'll always go fastest route: A true display of artificial intelligence! Full graphics, mazes a mouses! * AMOEBA KILLER - You command a one man submarine that has been shrunken to the size of bacteria in this exciting graphic adventuret injected into the president's bloodstream, your mission ravaging his bodyl LOGIC _ This popular game is based on Mastermind but utilizes tactics that make it more exciting and challenging - has 2 tevels of play to make it fun for everyone. *SUBMARINER - Shoot torpedoes at the anemy ships to get points. Fast action graphics, arcade type game is exciting and fun fo

ONLY 14.95

PACKAGE TWO INCLUDES: CHECK ERS 2.1 - Finally! A checkers program that will challenge everyone! Expert as well as amateur) Uses 3 -ply tree search to find best possible move. Picks randomiy between equal moves to assure you of FACE - The computer uses psychology as well as logic to try and beat you at poker. Cards are displayed using TRS-80's fuli graphics. Computer raises, calts, and sometimes even folds! Great practice for your Saturday night poker match! (Plays 5 card draw). PSVCHIC - Tell the computer a littie about yourself and he'll predict things about you, you won't amusement for parties. TANQLEMAN IA - Try and force your opponent into an immobite position. But watch out, they're doing the same to youl This graphics game is for 2 people and has been used to end stupid arguments. (And occasionally starts them!) *WORD SCRAMBLE - This geme is for two or more people. One person inputs a word to the computer
white the others look away. The computer scrambles the word, then keeps track of wrong guesses.

ONLY 14.95
HARDWARE \(\rightarrow\) TRS-80-HARDWARE MICRO SPEED
Upgrade your "slow" TRS-80 to a SUPER FAST MACHINEI! 12.66 MHZ) over 50\% FASTER! Some of the features

Auto turn-off during cassette or disk access. (This means NO lost programs EVERI) (Turns back on automatically too!) MANUAL control. (Unit may be turned on or off at any time. Yes even during program executionll Keyboard indicator light "blinks" when mi-cro-speed is on. Stops blinking when off! Don't wait for SARGON II or any other programil!! Comes with easy to follow instructions (Some soldering required.) OR take to your local computer store or TV-Appliance Center for quick installation. ( \(5 \cdot 10\) minutes 1 1 ) Works with any model. TRS-80

ONLY 29.95 complete
MICRO-BEEP make games more fun as well as provide useful sound output for professional applications!
Works with Any Model I TRS-80

PACKAGE THREE INCLUDES: POE TRY - This program lets you choose the subject as well as the mood of the poem you want, You give TRS-80 certain nouns or hames, then the mood, and it does the res't it has a 1000 -word, vocabulary of nouns, verbs, adiectives and adverbs! * erase, move as well as, Auto: draw, erase and move. Uses graphics bits not bytes Saves drawing on tape or disk! GALAC TIC BATTLE - The Swineus enemy have long range phasers but cannot travel at warp speed You can, but only have shori range phasers! Can you blitzkrieg the enemy without getting destroyed! \(F\) ul graphics - real time: *WORD MANIA Can you quess the computer's words using your human intuitive and iogical abilities
You'll need to, to beat the computer: AIR COMMAND - Battle the Kamikare pilots. Requires spilt second timing. This is a F AST action arcade game

ACKAGE FOUR INCLUDES: LIFE This 2-80 machine language program uses full graphics! Over 100 generations per minute make it truly animated! You make your starting pattern, the computer does the rest: Programn can be stopped and
changes madel Watch it growi SPACE Cranges madel Watch it grow' © SPACE
LANOER - This full graphics simulator Lets you pick what pianet, asteroid or moon you wish to land on! Has 3 skill levels that make it fun for everyone. * GREED it - Multi-level game is fun and challenging! Beat the computer at this dice game using your knowledge of odds and luck! Computer keep: track of his winnings and yours. Quick fast action. Hule the ancient city of Alexandria buy or sell land. Keep your people trom revolting! Stop the rampaging rats. Requires a true political personality to become good: * ROBOT HUNTER - A group of renegade robots have escaped and are spotted in an old ghost town on Mars our job as "Robot Hunter" is to destray he Dirate machines defore they kill any more settiers! Exciting! Challenging! Full graphics:

ONLY 14.95

PACKAGE SEVEN INCLUDES: BACK. GAMion s.0 - 2 different skill levels advanced piayers FAST (15 to average of Looks for pest possible move to beat you Looks for best possible move to beat you and uses international rules \&PEED READING - increases your reading oeed. Also checks for comprenension of material. Great or teenagers and adults to depth charges on moving subs. Lower depths get higher points in this last action graphics game. YAHTZEE - Piay Yaht isven more fun and challenging against a TRS-801 WWAL STREET - Can you
turn your 850.000 into \({ }^{\text {a million dollars? }}\) urn your 850.000 into a million dollars Simulates an actual stock market!

ONLY 14.95

PACKAGE SIX INCLUDES: 20 HOME INANCIAL PROQRAMS - Figures am. ortization, annuities, description rates, interest tables, earned interest on savings
and much, much more. These programs and much, much more. These programs the conscientious, inflation minded person.

TRS-80 IS A REGISTERED TRADEMARK OF TANDY CORP.
and west．If you are lucky，you may even spot a stream or a house．You must find a pass to get through those mountains．

At this point，you must decide how much food and water you will consume，as well as how much water and oats you will provide for the horses．This is done by entering a number from 0 to 100 ，which represents a per－ cent of the daily allocation．That is， 100 percent would be the amount you normally eat in one day； 50 percent would be half of that．While the wilderness is cer－ tainly no place to be gluttonous， the extent to which you ration affects your ability and the horses＇ability to travel．Cutting the ration below certain levels for a prolonged period of time could result in tragedy．

You are also asked to select the direction in which you wish to travel．In the mountains，you may be unable to travel in a cer－ tain direction．Also，you would be well advised to heed＂No Trespassing＂signs．

Every now and then you en－ counter dangers or opportuni－ ties along the way．In some in－ stances，you have a choice in what happens．In other cases， your fate is sealed by how wise－ ly you chose your supplies be－ fore the journey began．

\section*{Program Execution}

Table 1 shows the variables and their functions．Variables with an（s）refer to a subscripted item．

When the program begins ex－ ecution，the names of the supplies are loaded into the \(\mathrm{S} \$(\mathrm{~s})\) variables．The respective weights are loaded into \(\mathrm{G}(\mathrm{s})\) ．As each player picks his supplies，
the weights are stored in the ap－ propriate \(\mathrm{S}(\mathrm{s}, \mathrm{s})\) location．After all players have picked their sup－ plies，the G（s）variables are cleared，to be used later as indi－ cators for player and horses conditions．The ML，MP，PL，FL， and DL variables are loaded at the start of the program with special location addresses． These are actual video memory addresses and point to such items as water holes，streams， and mountain passes．

Miles traveled by each player each day is determined by multi－ plying a percentage of the total weight carried by factors for water and food consumed by you and the horses，your aggre－ gate condition and the horses＇ aggregate condition and the number of horses．The following equation is used：
\(C=(((1143-T(N)) / 4+10) \cdot W T)\)
\(\cdot N H(N) \cdot((S F(N)+H(N)) / 2)\)

The most critical aspect of the program is the ability to keep track of each player＇s loca－ tion on the map．To accomplish this，a \(40 \times 24\) virtual matrix is used．The term virtual is used to point out the fact that no actual memory is allocated to the ma－ trix．Only the actual coordinates of each player＇s location are stored in the \(X\) and \(Y\) variables．

To see how this works，visual ize a \(40 \times 24\) matrix．Each ele－ ment in the matrix represents 10 miles．A player＇s current loca－ tion might be \(X=30, Y=20\) ．If he travels west 30 miles，then the formula \(X=X-(30 / 10)\) gives his new location of 27,20 ．Traveling east，the distance would be add－ ed to \(X\) ；south the distance would be added to \(Y\) ；north the
distance would be subtracted from \(Y\) ．The area taken by the map is 60 characters across and 12 lines down．Using the follow－ ing formula correlates our imag－ inary matrix coordinates to the 1024 print positions on the video monitor．
\[
\begin{aligned}
\mathrm{PP}= & \mathrm{INT}((\operatorname{int}((\mathrm{Y}(\mathrm{~N}) / 2)+.5) \cdot 64) \\
& +(X(\mathrm{~N}) \cdot 1.5)+64) \\
& \text { PRINT@PP.}
\end{aligned}
\]

We now know where to print the＜＜indicator．But how do we know what lies in each direction from the current location？By adding the value of PP to the be－ ginning of video memory （15360），we have the player＇s lo－ cation as an actual video memo－ ry address．Usng \(\mathbf{Z}\) as the cur－
rent video memory location we PEEK（Z）for 146 （desert）， 170 （forest）or 188 （mountains）．De－ pending on the location，a one－ digit code \((0,1,2,3)\) is loaded into \(M(0)\) ，which is the variable for the current locaiton．We do the same for the six matrix loca－ tions（ 60 miles）in each direction in the following manner：

> West \(\quad M(1)\) thru \(M(6)\)
> \(Z \cdot 1, Z-2, Z-3, Z-4, Z-5, Z 6\)
> East \(M(7)\) thru \(M(12)\)
> \(Z+1, Z+2, Z+3, Z+4, Z+5, Z+6\)
> North \(M(13)\) thru \(M(18)\).
> \(Z-64, Z-128, Z \cdot 192, Z-256, Z-320, Z-384\) South \(M(19)\) thru \(M(24)\).
> \(Z+64, Z+128, Z+192, Z+256, Z+320, Z+384\)

The values of \(M(s)\) can then be examined to determine what is in any given direction．

Don＇t be misled by more expensive imitations！
This is the original Photo point light pen pre－ ferred and supported by some of the leading software sources like，＂Quality Software＂－＂In－ stant Software＂－＂Level IV＂products and so on，

\section*{Just imagine}

In playing backgammon，（included）when you want to move a man，you just point at where you want to move from，then point at where you want to move to，and your man moves！！！No more fumbling with keyboards－YEA！
Your Photo Point package comes complete；
－ 1 Photo point light pen（of course）
－Info sheets on how to connect the pen and how to write your own programs
ALL IN BASIC
－Two apertures
－AND two sensitivity settings
－A cassette tape with 4 informative programs and games
－Ready to connect to your TRS－80 System． （DOS too！）
－Does not void any Radio Shack warranties
Requirements：
－Level II basic
－And a little imagination！！
For fast real time programming it is your lowest cost peripheral at \(\$ 19.95\)

\section*{Announcing}

\section*{NEW PEN BASIC by Steve Bjork}

Steve is one of the Best Assembly Lang．pro－ grammers around，and he has come up with PEN BASIC．This low memory routine will add 10 more com－ mands to Level II such as PENGET which searches the entire screen for the pen and returns a number between \(0-1024\) in about 1 sec ．Plus 9 other commands．Perfect for you lightware authors and NEW light pen owners too！ only \({ }^{5} 14.95\)

\section*{Micro Matrix}

5000 ' DRAW MAP
"'Very powerful, underpriced, a must buy!"' Marcia Kalish, OCTUG Newsletter, May, 1980
"Keyplus is terrific. . . an incredible program." James Joachim, North Hollywood, CA.
"Thank you for your fantastic utility program." Mark C. Wehmhoefer, Chicago, IL.
"Makes the TRS-80 that much more versatile." Carl Pawl, Santa Monica, CA.

Keyplus is a powerful collection of utilities for the TRS-80. Routines can be enabled whenever the TRS-80 accesses the keyboard. A partial list of utilities includes:

AUTO REPEAT-Allows you to repeat a key simply by holding the key down. This is a must when editing BASIC programs.

LOWERCASE VIDEO-If your TRS-80 has a hardware modification installed for lowercase video, Keyplus will add the software needed to make it work.

BASIC SHORTHAND-Keyplus generates BASIC key words (GOSUB, INPUT, STEP, etc.) in a single key stroke. You have the option of having Keyplus print trailing blanks when practical, adding to the appearance of the listing.

RESTORE LOST BASIC PROGRAM-Ever NEW a program only to realize you did not record it? Two key strokes and you've got it back!

LOWERCASE WITHOUT SHIFT-Keyplus lets you generate lowercase from the keyboard without depressing the SHIFT key.

DIRECT KEYBOARD ENTRY OF GRAPHICS-Type graphic strings directly from the keyboard. This is the easy way to create BASIC programs with super fast graphics.

USER DEFINABLE STRINGS-Two user definable strings up to 32 characters long can be generated in a single key stroke. With this feature redundant input does not have to be retyped.

KEYBOARD DEBOUNCE-(LV. II, 16K version only) Keyplus cures debounce problems completely.

AUTO INPUT-(Disk version only) Allows you to define a string, save the string onto disk, and then recall the string, fooling the computer into thinking the string is being typed from keyboard. This is extremely powerful. For example, you can enter BASIC, set memory size, reserve file buffers, turn off interrupts, run a program, respond to questions asked by the program, etc., automatically from power up or from the DOS READY prompt.

SAVE KEYPLUS-(Disk version only) You can use this routine to allow Keyplus to be initialized with any combination of routines enabled or disabled. In addition, your user definable strings can be saved to disk!

Disk Keyplus comes on cassette with both the 32 K and 48 K versions recorded twice. The documentation gives detailed information on loading Keyplus to diskette.

TRS-80 is a registered trade mark of Tandy Corp.

NOW YOU CAN RUN YOUR TRS-80 RELIABLY 100\% TO 125\% FASTER (4 MHZ )! Our NEW speedup board enables programs to run \(50 \%\) slower than normal, normal, and \(50 \%, 70 \%, 90 \%, 100 \%\), or \(125 \%\) faster. A \(50 \%\) minimum increase is guaranteed ( \(90 \%\) to \(100 \%\) typical); however, DETAILED INSTRUCTIONS SHOW CHANGES REQUIRED TO THE TRS-80 THAT WILL INSURE RELIABLE OPERATION AT THE \(100 \%\) OR \(125 \%\) INCREASE! Software speed control with switch override option allows speed changes AT ANY TIME without program interruption. Our board also compensates for slow memory! Automatic slow down possible during cassette or disk operation (not required for TRSDOS, NEWDOS, and VTOS 4.0!). Power LED changes color (red - yellow - green) to indicate normal, slow, and high speed operation.

ASSEMBLED AND TESTED
\(\$ 37.50\)
VIDEO I. Provides black characters and graphics on an all white screen for a much crisper and easier to read presentation - gives none of the glare associated with plastic screen add-ons. Includes a unit to improve monitor performance.

\title{
DVM Interface for the 80
}

\author{
Karl J. Casper \\ Harry R. Freedman \\ Department of Physics \\ Cleveland State University \\ Cleveland, OH 44115
}

For recording scientific measurements, the TRS-80 is little better than a hand-held calculator if all of the data is entered through the keyboard. The 80 becomes a scientific instrument only when data can be read from a port. But in some cases, this data moves so swiftly that it cannot be read by a BASIC program.

An example of this is the information recorded by a digital voltmeter. The settling timethe time for the voltmeter to stabilize at a particular reading - is usually in the range of 0.3 to 1.0 seconds, which can conceivably be read in BASIC. But the digits in digital voltmeters are often strobed at rates of 500 Hz or greater - the appearance of a continuous display is only a consequence of the persistence of human vision.

No BASIC program can read information into the computer at this rate. Rather, a machine language program is required,
preferably one that can be easily linked to a BASIC program. When this linking is possible, the experimenter can write flexible programs in a high level language to analyze and display the data recorded through the machine language program.
In the past few years, singlechip peripheral interface adapters have been developed, such as the 8255 , which we have used to interface a Keithley Model 179 digital voltmeter to the TRS-80. The circuit attached to the TRS-80 requires only two additional chips and a third chip is mounted inside the Keithley DVM. All the connections are made by cable to the edge card connector on the rear of the 80's keyboard.
This same circuit can be used to interface any other relaydriven devices to the TRS-80 with suitable programming instructions. You can use it to monitor an air conditioner or in a security system to shut off and turn on lights, automatically.

\section*{The Interface}

Digital voltmeters not only come in all shapes and sizes; the digital information is displayed with different numbers of digits and by different decoding schemes. In liquid crystal displays, for example, all segments
of a seven-segment display are continuously available from the conversion circuit. A total of 35 to 40 lines, depending on the decimal point display, may be physically connected to the display circuit. Decoding this information with a TRS-80 requires a multiplex circuit that reads each digit in succession, a straightforward task, but with more wiring than we wanted.

The Keithley Model 179 digital voltmeter, like many voltmeters using light emitting diodes, strobes each digit into the display circuit. The lighted output is not continuous: Each digit is illuminated in turn for two milliseconds, then turned off for eight milliseconds. Each digit is illuminated in turn while the other digits are off.

Multiplexing a display in this way not only saves power, but the digital information is ideal for reading directly into the TRS-80. The time period of two milliseconds is more than long enough to read the data and store it in a memory location. Moreover, the information is in BCD form; the conversion to ASCII is trivial.

Photo 1 shows the front panel of the Keithley DVM. The voltage is measured in ranges from 0.2 volts to 2000 volts, the current in ranges from 0.2 mA to 2 amps ,
and the resistance from 2000 ohms to 20 megohms. The sign is automatically displayed.
This model DVM has no external connector to the TRS-80. We installed a 25 -pin connector on the back of the DVM and used cables between it and the interface box. Inside we added a board with one integrated circuit to wire from the range switches to the connector. Although this is simple, it does void the Keithly warranty.
Basically, the 8255 peripheral interface adapter (PIA) has three ports-any of which may be used as inputs and outputs and three modes of operation. In the first mode, called mode 0 , each of the three eight-bit ports, \(A, B\) and \(C\), can be programmed for either input or output by writing the appropriate control word to the PIA. There is no handshaking and any port can be switched between input and output functions by writing a different control word to the PIA.
Mode 1 permits input/output data to be transferred to or from a specific port with handshaking. For example, a device may strobe the PIA informing it that the device has data to be read. The microcomputer, which is programmed to poll Port C looking for a strobe, reads the data into the input buffer of either

Pasadena, California 91106

Port A or Port B. The PIA can then output the data to another external device in a similar fash. ion.
Mode 2 permits bi-directional communication with a peripheral device. Port C is used to determine the direction of data flow in both Ports A and B.
Initially, we connected the interface for mode 0 operation. However, this required a separate flip-flop which latched the TRS-80 into a Wait state until the data strobes arrived. There was nothing wrong with this as long as the data strobes were physically present to bring the TRS-80 out of this Wait condition.

We worried that the memory might not be refreshed, but Radio Shack kindly informed us that the Z-80 memory refresh cycle continued even in this state. The Z-80 simply executes NOPs during Wait to activate the refresh register.
However, of the eight different TRS-80's we connected to this interface, one unit apparently did not refresh during Wait, but did perform all other functions correctly.
Since it is unlikely that most users will have checked the Wait function, and since the additional flip-flop can be eliminated in mode 1, we abandoned mode 0 operation.

Though the techniques we use do not take full advantage of handshaking, the TRS-80 is
committed to reading the DVM as quickly as possible once the subroutine is accessed and is not allowed to perform any other function. It constantly polls Port \(C\) for the strobe marking the next digit to be read. After reading and strobing this data (approximately 50 microseconds), the TRS-80 returns to polling Port C.

\section*{The 8255 Circuit}

The complete interface circuit wiring diagram is shown in Fig. 1. The 8255, designated as IC2, is used in mode 1 operation.

Ports A and B are both inputs
and Port C directs the interface. The PIA is addressed by the TRS-80 whenever the instruction OUT 240 through OUT 243 is used. This address is decoded by the eight input NAND gate, ICI, and the address lines AO and A1.

Port A reads the digital data in BCD form. Since this information is desired in ASCII, the two high order bits PA4 and PA5 are connected directly to +5 volts. Thus, the number four is read as 34, which is decoded in ASCII as 4.

Port Breads all of the residual information about the sign of
the number and the range. As we will see, it is important to know if the DVM is measuring resistance. Pin PB1 reads this information.

It is also important to know if the DVM is connected to the interface circuit. Pin PBO measures the DC supply voltage to determine not only if it is connected, but also if it is turned on. If neither of these conditions is fulfilled, the program returns immediately to BASIC.
Of the three ports, Port C has the most work to do. Since the data from the DVM is stored in a string, it is necessary to deter.

Fig. 1. Interface wiring diagram. The additional 5-volt power supply needed for the 8255 is not shown.

\title{
Now NRI takes you inside the world's most popular microcomputer to train you at home as the new breed of computer specialist!
}

NRI teams up with Radio Shack
to teach you how to use, program and service microcomputers...make you the complete technician.
It's no longer enough to be just a programmer or a technician. With microcomputers moving into the fabric of our lives (over 200,000 of the TRS- \(80^{\text {Tx }}\) alone have been sold), interdisciplinary skills are demanded. And NRI can prepare you with the first course of its kind, covering the complete world of the microcomputer:

\section*{Learn At Home in Your Spare Time}

With NRI training, the programmer gains practical knowledge of hardware, enabling him to design simpler, more effective programs. And, with advanced programming skills, the technician can test and debug systems quickly and easily.

Only NRI gives you both kinds of training with the convenience of home study. No classroom pressures, no night school, no gasoline wasted. You learn at your convenience, at your own pace. Yet you're always backed by the NRI staff and

Training includes TRS-80 computer, transistorized volt-ohm meter, digital frequency counter, and the NRI Discovery Lab with hundreds of tests and experiments.
(TRE-80 is a trademark of the Radio Shack division of Tandy Corp.)

your instructor, answering questions, giving you guidance, and helping you over the tough spots.

\section*{Explore the TRS-80 Inside and Out}

NRI training is hands-on training, with practical experiments and demonstrations as the very foundation of your knowledge. You don't just program your computer, you introduce and correct faults ..watch how circuits interact...interface with other systems...gain a real insight into its nature.

You also build test instruments and

\section*{Send for Free Catalog... No Salesman Will Call}

It shows all equipment, lesson outlines, and facts on other electronics courses such as Complete Communications with CB, TV and Audio, Digital Electronics, and more. Send today, no salesman will ever bother you. Keep up with the latest technology as you learn on the world's most popular computer. If coupon has been used, write to NRI Schools, 3939 Wisconsin Ave., Washington, D.C. 20016. the NRI Discovery Lab, performing over 60 separate experiments in the process. You learn how your trouble-shooting tools work, and gain greater understanding of the information they give you. Both microcomputer and equipment come as part of your training for you to use and keep.

mine the arrival of the first digit. The digit strobes are differentiated by RC circuits which are physically wired inside the DVM. Each circuit is an input for a diode OR circuit which then applies a signal to \(S T B(B)\) at the arrival of a digit strobe - not necessarily the first one.

The first digit strobe is also connected to STA(A). Since this strobe is differentiated, this pin returns almost immediately to a logic 1 state, and, about 0.3 microseconds later, \(\operatorname{IBF}(A)\) will be set to logic 1 . If both \(\operatorname{IBF}(A)\) and \(\operatorname{INTE}(A)\) are high, then \(\operatorname{INTR}(A)\) will be set to a logic 1 state. The computer can check the level of INTR(A) to determine when the first digit strobe arrives.

The actual execution of the main program takes less than 100 microseconds, and the remaining digits can be read in turn by checking INTR(B).

The PIA IC2, the eight-input NAND gate IC1, and the inverter IC3 are mounted in a minibox with a separate power supply as shown in Photo 2. About 60 mA total current is required by these chips, and neither the TRS-80 nor the Keithley DVM have that much to spare. A separate +5 volt power supply was used.

The interface box is attached by ribbon cables to the rear of the TRS-80 and to the Keithley DVM to a 40 pin jack that we mounted on the rear of the voltmeter. In this way, the adapter can be used for interfacing other equipment to the TRS-80.

When operating the three PIA ports as input, it is advisable to return the pins to ground through a resistor as is shown for pins PB4-PB7. We chose the 27000 ohm resistors because we had so many of them in our stock, but somewhat smaller or larger resistors would work just as well.

The decimal is not read as input data by Port \(A\). The information is obtained through each range switch input on Port B. Moreover, we assume that the user knows whether volts, amps, or ohms are being measured. The wiring and the program are simplified by that assumption.

If the voltmeter is set to ohms,
then PB1 will be set high, but that particular piece of information is determined only to place the decimal point correctly. The sign is determined by the logical value at pin PB2. If it is positive, then that point must register a logical 1.

Finally, pin PBO determines that the digital voltmeter is turned on by checking its power supply. If the power is off, the program returns to BASIC with a reading of 0 . This pin is continually polled during the execution of the program. If the fivevolt power supply is off, no strobes appear and the program finds itself in an endless loop.
Using a PIA simplifies the circuit enormously. Only four integrated circuits are actually needed, and the software control subroutine is concise and easily written.

The PIA is controlled through Port 243. This is not real port, but selects the control word that defines the mode of the PIA ports (Fig. 2).

Selecting Ports A and B as in. put and both upper and lower halves of Port C as an output when the chip is operating in mode 1 means that the control word should be 10110110 or B 6 H . This mode continues until changed by writing a different control word to 243.

\section*{Imbedding the Subroutine}

The machine language sub. routine can be imbedded in the BASIC program by using string packing techniques. These were described among others by Mike Schmidt and Leo Christopherson in the May/June and July/Aug., 1979 issues of 80 U.S. and by James Garon in the July, 1979 issue of the Orange Country Users Group Newsletter.

The machine code is literally stored as bytes in a character string in a BASIC statement. The starting address of this string is then passed on to the USR subroutine. Calling USR, accesses the machine language program.

The first step in the process is the creation of a program which will store the machine code as bytes in a string. The following statement defines a string vari-
able which must contain as many bytes as the machine language program:

9000 AS \(=\)
The line number 9000 is arbitrarily chosen, but to append this program to another, the line number should be larger than the other numbers in the BASIC program. The machine language subroutine is POKEd into the addresses corresponding to the bytes in the string. Each of the bytes represented by an asterisk or a number is replaced by one byte of the machine language program.

The input buffer, which interprets each line of a BASIC program before storing the line in memory, is only 255 bytes long. Therefore the machine language subroutine must not exceed 255 bytes, less the number of bytes needed for the line number and the characters \(\mathbf{A S}={ }^{\prime}\) and the closing quotation mark.

The next step in the process picks up the beginning address of the string. The following
statements are needed:

9010 A1 \(=\) PEEK (VARPTR(AS) +1 ) 9020 A2 \(=\) PEEK(VARPTR(AS) +1 \(9030 \mathrm{~A} 3=\mathrm{A} 2 \cdot 256+\mathrm{A}_{1}\)

These statements set A1 equal to the least significant byte of the starting address of the string, A2 equal to the most significant byte of the address of the string, and A3 equal to the starting address of the string in decimal form.

The USR function in Level II BASIC looks for the least significant byte of the starting address of the machine language subroutine at location 16526 and the most significant byte of the address at 16527. The following statement passes the beginning address of the string to these locations:

9040 POKE 16526,A1 : POKE 16527,A2

Before storing these statements as a subroutine, the characters in the string must be replaced with the machine language program. After assem-

MTL-1 \$9.95
MANHATTAN SOFTWARE, Inc. -90 P.O. Box 5200 Grand Central Station New York City, New York 10017
bling the program using the Editor/Assembler, the machine language code is written in data statements in decimal form:

10010 DATA \(217,221,229,245,175,40,1,1,1,1\).
1,1,1,1,1,1,79,6,5.221
10020 DATA \(42,142,64,221,54,7,45,62,147\). 211.

243,62, 128,211,242,219,242,87, 175,211
plus as many additional data statements as are necessary. Any number of bytes, up to approximately 250 , can be entered into a single data statement, but editing a data statement containing more than 20 bytes is inconvenient and time consuming. In general, the actual number of bytes in a data statement and the format seems to vary widely according to individual preferences. The one used here is easy for us to edit and modify.

After writing N bytes into data statements, the following steps read them into the string:

10100 RESTORE
10110 FORI \(=0\) TO N. 1
10120 READ D : POKE A3 + I,D
10130 NEXT I

The complete program for reading the DVM subroutine into a string is shown in Program Listing 1. The first statement sets aside enough bytes for storing the string. This statement must exist in the BASIC program where this subroutine will be used.

When storing this subroutine on tape, only five steps, 9000 through 9040, will be retained. All other statements in the program in the listing may be deleted. The subroutine may form part of a general library of subroutines that are appended to a BASIC program. The symbols A1-A3 and AS are arbitrary and may be changed and the line numbers may be renumbered at any time. Statement 9000 contains the machine language subroutine which is called by the statement \(\mathrm{X}=\) USR(0). Any number of subroutines may be included in a program. It is only necessary to POKE the starting address of the subroutine into locations 16526 and 16527 each time that you wish to change the subroutine called by the USR function.

Even if the subroutine de-

Photo 1. Front panel of Keithley digital voltmeter.
scribed here is the only one used in a program, it is desirable to access it in the following way:
```

2000 FOR N = 0 TO 99
2010 GOSUB 9000
2020 X = USR(0)
2 0 3 0 ~ N E X T ~ N

```

The important step is line 2010. If any BASIC statement is inserted into the program at any time, the BASIC interpreter automatically reallocates memory storage of the rest of the BASIC program including the string containing the subroutine. The validity of the addresses that have been so carefully POKEd into locations 16526 and 16527 is lost. To restore that validity, the beginning address must be rePOKEd into those memory locations. Although it adds some time to the program, lines 2010 and 2020 should always be coupled in writing BASIC programs.

\section*{Subroutines from Disk}

If the program is to be used with Disk BASIC, then, as Garon has pointed out, it is necessary to replace line 9040 with 9040 DEFUSRO = A3 .

The subroutine can then be called with the statement \(X=\) USRO(0). Subroutines stored in Disk BASIC are even more easily appended to BASIC programs. The greater storage capacity and speed of the disk simplify programming, and line renumbering is a utility usually available in most disk operating systems. The procedure is quite similar to that used in large computers when accessing library subroutines.

After the data statements are read and the code POKEd into the string, line 9000 now has bytes in the string that BASIC in-
terprets in several ways. For example, suppose that line 9000 originally set aside 10 bytes for a subroutine consisting of the following: 49,50,51,52,53,54,55, \(56,57,58\). This subroutine does nothing, but after POKEing the bytes into the string, line 9000 would look like this: \(9000 \mathrm{~A} \$=\) "123456789:". These are the ASCII equivalents of the bytes in the string.

The Level II BASIC interpreter checks each byte in a BASIC statement to determine if it is:
A) A control code;
B) An ASCII character;
C) A token;

The second edition of the Level II BASIC reference manual provides more information about this procedure on pages \(C / 2\) and 3 , and page E/1. When the interpreter sees a byte between 21 H and 5 FH , it interprets that byte as an ASCII character in the way shown in this illustration.

One byte in this group must be avoided, 22 H . This is interpreted as the ASCII character and signifies the end of the string.

For bytes between 80 H and FAH, and for the byte FFH, the interpreter sees that bit 7 is set and understands that the byte is a token for one of the BASIC functions. This results in less memory being needed in Level II for storing a BASIC program and gives an interesting appearance to the string.

Unfortunately, the second edition of the Level II manual overlooks the token for 80 H (128D) which is END and the token for 255 which is ISA. If the data statement in the example contains the code \(229,213,195\),

ORDERING INFORMATION
We accept Visa and Mastercharge. We will ship C O D. certified check or money orders only. Massachusetts residents add 5 percent sales tax

The Company cannot be lieble for pictorial or typographical inaccuracies.

\section*{Client Write-Up System*}

The Client Write-Up System allows for the quick preparation of financial records (General Ledger, Balance sheet, Income Statement) for a client.
One time entry of general ledger and payroll accumulation by employee.
Calculates and accrues employer taxes for Social Security. Federal and State U/C taxes. User furnishes the taxable wages and rates and the computer sets up the liability and expense.
Allows up to ten repetitive entries for depreciation and amortization of prepaid expenses, which are entered into the Client Master File and automatically updated monthly.
General ledger account and employee names are displayed when keyed by the user.
Can consolidate individual master files into one profit and loss statement, and one balance sheet.
All constants such as tax rates, taxable wages, etc. are user furnished in the Client Master file.

\section*{Roports}
\(\begin{array}{ll}\text { Trial Balance } & \text { Comparative I/S and B/S } \\ \text { General Ledger } & 941 . W-2\end{array}\)
Income Statement
Balance Sheet

\section*{Time Analysis System*}

Accurate accounting of the billing of time and services rendered is the goal of the Time Analysis System (TAS).
Activity file can be custom tailored by the organization to fit individual business applications.
Employee time is categorized into different activities.
Activities are entered into the client file and reflect the activity performed, and the time spent by the employee.
Rates are assigned to each employee and are used to bill the employee's time.
Rate and activity amounts to be billed are computed and maintained as a Work-In-Progress amount.
All or part of the Work-In-Progress amount is transferred into an accounts receivable amount at the end of the month.
Statements are printed reflecting the accounts receivable amount owed by the clients.

\section*{Roports}

Activity File
Employee File
Employee Activity Report
Client Activity Ledger

Client File
Statements
\(\$ 200.00\)

\section*{Asset Depreciation System*}

The goal of the Asset Depreciation System (ADS) is to keep accurate records of a client's assets and subsequent depreciations.
Depreciation of a given asset is computed by one of five standard methods: Straight Line, Sum-ot-the-Year's-Digits, Double Declining Balance, 1.50 Declining Balance, and 1.25 Declining Balance. Dates used with the purchase of the asset are rounded to the nearest month start.
An asset, at the end of useful life, is terminated by one of four methods of disposal.
ADS houses a general ledger chart of accounts so that the accountant's own general ledger may be easily cross-referenced with the ADS.
The asset cost and accumulated depreciations are grouped by the ADS general ledger.

3 5 \(1 / 4^{\prime \prime}\) Disk Drives

Houston Micro-Computer Technologies, Inc. 5313 Bissonnet Bellaire, Texas 77401 713/661-2205

219,241,211,243,217,209,201, then the resulting string would appear as:

9000 AS \(=\) PEEK \(=\) ERRINPCDBLORLENA BS(KEY§"
all of which are tokens for this particular machine code.

Real problems begin when the interpreter encounters the bytes FB, FC, FD and particularly FE . All of these have a destructive appearance when the program is listed although the machine code remains intact with FB, FC and FD. For most scientific programs it is better to work around opcodes using these bytes, thereby making it simpler to debug and modify the programs. For these bytes and the following, the effects can be observed by POKEing the following bytes into line 9000:

10000 DATA \(49,58,51,52, C C, 53, C C, 54, C C\), 55

For CC, simply substitute the desired bytes, and after POKEing, list line 9000.

Similar problems occur when the interpreter encounters bytes below 20H. From the Level II manual, these bytes are used for control codes for I/O functions. Trouble starts with byte 0 . The BASIC interpreter, seeing this byte, thinks that it has reached the end of a line and that the
next byte is the beginning of a new line. Machine code containing this byte must be avoided at all times.

The next byte 01 causes no problems, since the BASIC interpreter simply ignores it in displaying the string, although the machine code is stored in the correct memory locations. For example, if the data statement contains the bytes:

10000 DATA \(49,50,51,52,1,53,1,54,1,55\)
then after reading this into the string line 9000 will have the appearance: \(9000 \mathrm{~A} \$=\) "1234567"

The 01 byte has been ignored and it appears that the string only has seven characters. But when the memory locations corresponding to the string are examined, all of the bytes are found in the right places.

The use of bytes seen as control codes can be summarized as in Table 1. All bytes are shown in decimal form.

\section*{Machine Language Subroutine}

In constructing the machine language routine with the TRS-80 Editor/Assembler, we followed several principles. First, the subroutine is to be imbedded in the BASIC program which dynamically reallocates it to different portions of memory and obviates setting aside any specific portion of memory.

Photo 2. Minibox containing complete interface circuit. Box is larger than necessary for future interfaces.

\(\star \star \star\) A PERCOM BULLETIN \(\star \star \star\)
} Adapter for TRS-80* computer eliminates disk read errors

Garland, Texas - Harold Mauch, president of Percom Data Company, announced that the company is marketing a simple plug-in adapter for TRS-80* computers that corrects a design deficiency in the disk controller circuit.

The problem, which causes disk read errors, has been traced to Tandy's reliance on a circuit internal to the FD1771 controller IC to perform the function of separating clock and data pulses.

As explained in the Backgrounder, use of the internal chip circuit for reliable data-clock separation is a design shortcut which the manufacturer of the controller IC warns against.

The Percom solution, a PC card adapter called the SEPARATOR \({ }^{\text {TM }}\), eliminates the problem by substituting an explicit data separator circuit

Percom adapter fixes TRS-80* computer disk controller.
- one which has been used reliably in Percom disk controllers since 1977 - for the internal IC separator circuit.

The SEPARATOR \({ }^{\text {TM }}\) is installed without modifying the host system. The user merely removes the FD1771 IC from
the host controller, installs the IC in the DIP socket on the SEPARATOR \({ }^{\text {TM }}\) card, and plugs the adapter into the vacated socket of the host controller.

Percom cautions that opening the Expansion Interface of the TRS-80* computer, which is reguired to install the SEPARATOR \({ }^{\top M}\), may void the computer's limited 90-day warranty.

The SEPARATOR \({ }^{\text {™ }}\), which sells for \(\$ 29.95\), may be purchased from Percom dealers or ordered direct from the factory. The Percom tollfree order number is 1 -800-527-1592.

Payment for mail orders may be made by certified check, cashier's check or money order, or charged to a Master Card or VISA account. Texas residents must add 5\% sales tax.

\section*{Percom Mini-Disk Drives Store More, Cost Less.}

Percom mini-disk drives store more data, are more reliable, yet a 40 -track Percom drive costs \(\mathbf{\$ 1 0 0 . 0 0}\) less than a 35 -track Tandy drive.

You can store over 102 Kbytes per disk on Percom TFD-100"4 40-track drives, over 197 Kbytes per disk on TFD-200"7 77-track drives. A patch - supplied free on minidiskette - upgrades TRSDOS \({ }^{\circ}\) for operation with the newer 40 - and 77 -track drives.

Both TFD-100 \({ }^{\text {TM }}\) and TFD-200 \({ }^{\text {TM }}\) models are available in one-, two- and three-drive configurations.

Prices start at \(\$ 399\) for a single-drive TFD-100 \({ }^{\text {TM }}, \$ 675\) for a single-drive TFD-200 \({ }^{\text {TM }}\). Drives are supplied with heavy-duty power supplies. Metal enclosure is finished in compatible silver enamel.

See your nearby Percom dealer or order direct by calling toll-free 1-800-527-1592.

\section*{Five-Inch Disks Store More Than Eight-Inch Disks!}

Garland, Texas - June 25, Model I computer is about 290 1980 - Percom Data Company Kbytes.
has begun production of a double-density disk controller adapter for TRS-80* Model I computers.

Harold Mauch, president of Percom, made that announcement here today, saying that data storage capacity using the adapter and double-density disk operating system - which is included - can be increased to as much as 354 Kbytes per minidiskette.

By comparison, the maximum storage for larger eight-inch disk systems used with the TRS-80*

Mauch said the PC card adapter, which plugs into the controller chip socket of the computer Expansion Interface, works equally well for either single-density or double-density storage, and users may continue to run programs under TRSDOS* OS-80 \({ }^{\text {th }}\) and other single-density operating systerns with the adapter installed.

Price, for the plug-in adapter, the TRSDOS*-like double-density DOS and a utility for converting files and programs from single- to double-density format is \(\mathbf{\$ 2 1 9 . 9 5}\).

\section*{CRC ERROR! TRACK LOCKED OUT!}

\author{
by the Technical Staff \\ Percom Data Company
}

This problem started while we were studying an annoying problem with the TRS- \(80^{\circ}\) computer. Disk drives sold by Percom are realigned and tested before shipment. We noticed, however, that some disk drives would pass the Percom inspection but just would not work reliably on the inner tracks with a TRS- \(80^{\circ}\) computer. These drives were within the manufacturer's specifications, and would function perfectly on other disk systems Percom manufactures - "perfectly" here meaning more than 50 million bytes read without error!

The disk read data separation arrangement in the TRS-80* computer Expansion Interface uses an internal data separator of the FD1771 disk formatter/controller IC. Use of the FD1771 internal data separator is not recommended by Western Digital, the IC manufacturer. The following note appears on page 17 of the FD1771 data sheet:

Internal data separation may work for some applications. However, for applications requiring high data recovery reliability, WDC recommends external data separation be used.

We suspected the data separator because the problem was most severe on disk inner tracks where storage density is highest and data separation is most critical.

To prove our point, a technician breadboarded a standard Percom data separator circuit, and configured it to plug directly into the FD1771 IC socket of the TRS- \(80^{*}\) computer controller.

When connected to the TRS \(-80^{\circ}\) computer, a troublesome drive functioned perfectly! We ran a BACKUP utility many times and never got a track lockout. Before we added the external data separator circuit to the computer, this same drive would always lock out tracks, and would have difficulty reading from the inner (higher number) tracks.

The Percom data separator circuit fixes the mini-disk controller of the TRS-80* computer. The type of drives being used is irrelevant; the circuit eliminates disk read errors resulting from the inability of the Tandy controiler design to reliably separate clock and data signals when reading high density inner tracks.

Program Listing 1. The BASIC program listing. Lines 2000 to 2050 are a sample program in which the voltmeter reading is passed to the variable \(X\).

Therefore, absolute jumps and loads to specific memory locations are not used; all jumps and loads are relative with one significant exception.

The memory location 408EH holds the starting address of the subroutine and is loaded into the IX index register. Since a displacement may be added to the index register, it is possible
to set aside space for storing the bytes from the digital voltmeter reading within the string itself.

Second, as mentioned before, some machine codes were avoided. The subroutine is intended to be added to a number of different BASIC programs which need input data from a digital voltmeter. If it produces a
string that is difficult to read when displayed or printed, then it is correspondingly difficult to integrate into programs written in BASIC. Such a subroutine will have little value for any scientific work.

Avoiding these codes poses some difficulties in creating subroutines, but we restrict subroutines created in this way to only common ones which are called many times in the execution of a single program. Overcoming the difficulties has its rewards.

The machine language subroutine is shown in Program Listing 2. The listing shows that memory location 72FIH has been chosen as the origin of the program. This selection is completely arbitrary, but some origin must be specified with the TRS-80 Editor/Assembler. This address is never used in the subroutine. If, after assembly, it or other addresses near it should appear in the code, the program contains, incorrectly, absolute jumps or loads.

Steps 100-140. The entry is defined as DVM and, since all of the registers are used, all are initially pushed into the stack or exchanged with the alternate registers. In general, the HL reg. ister must be saved since it points to the current cursor position. This register must be restored just before returning to the BASIC program.

Steps 150-210. Step 150 loads zero into the A register and sets the zero flag. The former is essential for storing a zero byte in step 190 in the C register. The latter enables us to use the command JRZ,NEXT which has the opcode 2809 rather than JR NEXT which has the opcode 18 09.

The ASCII representation for 28 H is (, but 18 H is a control code which backspaces the cursor and is one that will be avoided where convenient.
Step 170 sets aside space for storing the decoded digits from the voltmeter. While only eight bytes are really needed, the control code for eight is one that is

also avoided. When the data statement is written with these bytes, the code 01 is entered in each of the nine locations, as can be seen in the data statement 10000 shown in Fig. 2.

Step 180 loads the number of digits that will be read from the voltmeter into register B, while step 190 loads 00 into register C. If only four numbers were to be read, then register B would be loaded with 04.

Step 200 stores the starting address of the program into the index register IX. Whenever USR subroutine is called, the operating system immediately checks memory location 408 EH for the beginning address of the subroutine. This is the only absolute memory location used in the program and it is loaded into the index register to determine the start of the buffer storage string.

Based on the number of bytes that have already been written into the program, the first byte of the storage string occurs at \(1 X+7\). This byte must contain the sign of the voltage, initially set negative by step 210 .

Steps 220-350. The peripheral interface adapter must now be initialized. Fig. 2 shows the control word that must be used to define operation in mode 1 . The control word used in step 280 is 190D, bit pattern 1011 1110. This sets Port A in mode 1 input and Port B in mode 1 input. This control word also has bit 4 high, thereby setting PC6 and PC7 of Port C as input.

In mode 1, the other lines of Port \(C\) are committed to the INTR, IBF and STB functions. Therefore, it is immaterial whether bit 0 of the control word is high or low.

Steps 310.320 enable the INTE flip-flop for Port A and steps \(330-340\) enable the INTE flip-flop for Port B in agreement with the bit SET/RESET control word shown in Fig. 2. These in. terrupt-enable flip-flops remain enabled during the entire subroutine.

Step 350 is a precaution to ensure that the interrupt request line of Port B has been reset to zero. No other initialization is needed.

Steps 360-390. These steps
check to see that the voltmeter is actually turned on. Since the subroutine loops until strobes arrive from the digital voltmeter, the power must be on if the computer is not to loop forever. The initialization procedure set the PC6 line of Port \(C\) as an input, and this point is connected to the +5 volt power from the digital voltmeter. The port is read, and the bit compared in step 380 . If zero, the subroutine jumps to DVG at the end of the program, restores the registers, and returns to BASIC.

Steps \(400-430\). The initialization procedure has set the interrupt enable flip-flop of Port B high. A differentiated negativegoing pulse signaling that the voltmeter is displaying the first digit, is connected to PC2, the strobe input for Port B. Once this point sees this logical 0 pulse, data is loaded into Ports \(A\) and \(B\) and, 300 nsec later, IBF is set to a logical 1 .
Since STB is differentiated, it returns to a logical 1 very quickly. When STB, IBF, and INTE are all high, then INTR of Port B is set to a logical 1.
In these steps, line PCO on Port A which contains the logical information about \(\operatorname{INTR}(B)\) is continually checked. After it is set to a logical 1, the program continues.
Steps 440-500. When the program has reached this point, the digits are read in proper order, but it is necessary to read the sign and to insert the decimal point at the correct place in the string. Although a different order for the subroutine could have been chosen, the 2 millisecond spacing of the digit strobes leaves more than enough time for the program to check the decimal point before reading each digit.
To understand the way in which the decimal point is read, notice the way in which the Keithley voltmeter displays its digital information for volts, amperes and ohms as shown in Table 2.

The simplest way of returning information to the BASIC program is in volts, milliamperes and kilohms. If the voltmeter is reading volts and milliamperes, the decimal point must be

\section*{If you ever do Assembly language programming, or you just want to know more about your TRS-80 ROM, "THE BøのK" is for you.}

Volume I will give you access to over fifty machine language subroutines in the Radio Shack Level II BASIC. It includes information on the numeric data formats and a commented listing of the ROM routines.
"THE B \(\emptyset \emptyset K\), Volume I", encompasses all arithmetic functions and mathematical operations. There are separate routines for integers, single precision, and double precision numbers and the data format for each of these number types is explained. The routines that perform ASCII to binary and binary to ASCII conversion are identified and explained to provide you a means of data \(1 / \mathrm{O}\).
A fully commented listing provides the details on the step-by-step execution of these ROM routines. Although a complete disassembly is not provided in order to avoid copyright infringement, you can obtain a complete disassembly using the disassembler program listed in "THE B \(\varnothing \varnothing\) K." Volume I also includes a complete, detailed memory map of the entire machine and a symbol table noting over 500 addresses.
"THE BøØK" will save you hour upon hour of assembler program development time. Don't start programming without it.
Order your copy of "THE B \(\emptyset \emptyset K\) ", today!

moved three places to the left whenever the meter is set to the 0.3 , or 200 microamperes, range. For this range, the decimal point must be inserted into the string immediately after the sign byte However, from Photo 1 the 0.3 volt range on the DVM also corresponds to the \(\mathbf{2 0 0 0}\) ohm range. From Table 2 it can be seen that the decimal point for the ohms range must be moved one place to the right and inserted as the second, not the first byte, after the sign byte in the string.

\section*{Storing in Port B}

All of the information about the decimal point is stored in Port B by forcing one of the pins \(B(4)\) through \(B(7)\) high when the respective 0.2 volt through 200 volt range switch is closed. It is not necessary to connect the 1KV/1AMP/20MEGOHM range switch to the B port. If none of the other range switches have been closed, then this range must be the one that is selected

The pin that corresponds to the closing of this switch is \(\mathrm{B}(0)\) which is connected to the DVN power supply and is, therefore, always high

Inserting the decimal point at the correct place in the string requires that we check the various bits of Port B, read and stored in register \(D\) in steps 450-460. If the voltmeter is set on ohms, pin \(B(1)\) is also high. Since an additional shift of the \(D\) register to the left is needed when reading ohms (step 490), setting this pin high correctly sets the decima point for the \(\mathbf{2 0}\) megohm range An important part of this routine is step 490

While the steps through step 730 load in the decimal points correctly for volts and mil liamps, the last decimal point, loaded when the voltmeter is se to the 20 megohm range, re quires the additional set of steps labeled DVOHM to load it into the string. The C register is set to zero if the decimal point is
\begin{tabular}{|c|c|}
\hline 0 & Avoid. The interpreter thinks it has reached the end of the line. \\
\hline 1.7 & No effect. They will not appear when the string is displayed. \\
\hline 8 & Backspaces and erases character, but stores correct machine code. When used with the example program, the string is displayed as 9000 \(X \$=" 1237 "\). The characters four, five and six have been erased. \\
\hline 9 & Same as the code 1.7. \\
\hline \multirow[t]{5}{*}{10} & This control code activates the line feed with a carriage return (see control code 26). When used with the example program, the string appears as: \\
\hline & \(9000 \times \$=-1234\) \\
\hline & 5 \\
\hline & 6 \\
\hline & \(7{ }^{\prime \prime}\) \\
\hline \(11 \cdot 13\) & These move the carriage to the top of the page and have the same effect as 10. They cause no problem except in printing. \\
\hline 14.22 & These are identical to 1-7. \\
\hline 23 & This converts the display format to 32 characters/line, although it does not appear in the string. It is one of the codes we avoid. \\
\hline 24 & This character backspaces the cursor and has the same effect as 8. \\
\hline 25 & This advances the cursor. When used with the example program, the string appears as: \(9000 \times \$=" 1234567 "\) \\
\hline \multirow[t]{5}{*}{26} & This code is similar to 10 , giving a linefeed, but unlike 10 , there is no carriage return. When used with the example program, the string appears as: \\
\hline & \(9000 \times \$=1234\) \\
\hline & 5 \\
\hline & 6 \\
\hline & \(7{ }^{\prime \prime}\) \\
\hline 27 & We avoid this, although the bytes are stored correctly. This controt code gives an upward linefeed in contrast to 26 which is a downward linefeed. The listing becomes garbled and difficuit to work with. \\
\hline 28 & Avoid. Although the bytes are stored correctly, this code homes the cursor creating a listing which is nearly impossible to read. \\
\hline 29 & This code is only half bad. When used with the example program, the line number partially disappears and the string appears as \(7^{\prime \prime} 00\) X \(\$=" 1234\). The BASIC interpreter still thinks that this is line 9000 and places it in the program correctly, but depending on its place in the program, this code may create statements that are difficult to renumber or manipulate, particularly if more than one subroutine is used. \\
\hline 30-31 & These are the same as 1.7 . \\
\hline 32 & This is the control code for space. When used with the example program, the string appears as: \(9000 \mathrm{XS}=\) "1234 567 7". This code causes no problems. \\
\hline
\end{tabular}

\title{
Introducing a new line of cases and power supplies (with or without disk drives!)
}

\section*{The choice is yours}

Whether you need professional-looking cases and power supplies for your present hardware or complete disk drive packages, call A.M. Electronics. We manufacture a complete line of affordable, high-quality and readily-available disk drive components to expand your TRS-80" system.

\section*{Disk drive enclosures}

All of our disk drive enclosure products feature:
- One year power supply guarantee. Each unit is 100\% tested, regulated and fused.
- Optimum top-and-bottom venting for improved convection cooling and lower operating temperatures.
- Excellent RF interference shielding. Steel covers come with lustrous dark grey finish to complement your TRS-80 \({ }^{\text {ru }}\) hardware.
- Built-in provisions for optional extender cable ( \(51 / 4\) only).

\section*{Complete disk drive packages}

Our complete disk drive packages feature proven MPI and Siemens drives and are designed to meet all your storage requirements. As with everything we sell, A.M. Electronics tests each drive for \(100 \%\) reliability prior to shipment.

\section*{Manufacturer-direct savings}

When you order from us, you buy directly from the manufacturer. There are no "middlemen" between us and our customers, so you'll realize significant savings like these:
COMPLETE DISK DRIVE PACKAGES
51/4-Inch drives
40-track MPI 51 w/case, power supply
\& extender cable ..... \$350
80 -track MPI 91 w/case, power supply\& extender cable560
Dual MPI 51's w/dual case, power supply \& extender cables ..... 650
Dual MPI 91's w/dual case, power supply \& extender cables ..... 1070
SPECIAL OFFERI 8-Inch drives for Model I or II
Single Siemens drive w/case \& power supply ..... 695
NEW! Dual Siemens drives w/dual case \& power supply ..... 1240(90 day limited warranty on disk drives)
CASES AND POWER SUPPLIES
51/4-Inch enclosures
Single drive unit case \& power supply ..... \$85
Dual drive unit case \& power supply ..... 120(Extender cables are \(\$ 15\) each extra)
8-Inch enclosures
Single drive unit case \& power supply ..... 150
NEW! Dual drive unit case \& power supply ..... 250
Attention dealers, OEM's \& distributors

loaded into one of the first four positions. It is the logical register to use to signal that the voltmeter is set to zero.

In step 500, the accumulator is loaded into the C register. If the voltmeter is set to ohms, then bit 1 must be high, and it will be used in the sequence labeled DVOHM.

Steps 510-550. Having set the decimal point correctly for the possibility of ohms, the program now determines the sign of the number by checking bit 3 or Port \(B\) (step 510). If this bit is low, the negative number originally loaded into the string is left there. If bit 3 is high, this byte in the string is replaced with 2 BH , which is interpreted as the ASCII character + .

Steps 550-600. In this portion of the subroutine, the decimal point is placed correctly in the string. The process of checking the various bits of Port B is done by checking bit 4 of the \(D\) register. If it is high, then the decimal point is read into the string. If it is not high, a digit is read into the string and the \(D\) register is rotated to the right. The next time that a digit strobe occurs, bit 4 is again checked to see if the decimal point should be read into the string. Since bit 0 of Port \(B\) is wired high, a decimal point must eventually be inserted into the string.

As an example, suppose that the voltmeter is set on the 20 volt range. Bit 6 of Port B and also in the \(D\) register is high, and the stored string must read \(+\mathrm{XX} . \mathrm{XXX}\).

The first time around, the program checks bit 4 of the \(D\) register and finds that it is zero. The first digit is read into the string and the \(D\) register rotates to the right one place so that bit 5 is

\section*{now high.}

The second time around, the program again finds bit 4 low and reads the second digit into the string while rotating the \(D\) register to the right once more.
After this rotation, bit 4 in the \(D\) register is high and the program reads it into its proper place in the stored string. After reading the decimal point into the string, the index register is incremented so that the next digit does not replace the decimal point. Then steps \(600-630\) set the D and C registers to zero to avoid the possibility of reading any other decimal point into the string.
Steps 640-730. Before reading the digits, the \(D\) register is rotated to the right to set up the next check for the decimal point. The index register is incremented in step 660 and the first digit is finally loaded into the string in steps 670 and 680. Port A contains the four-bit BCD digit from the voltmeter in bits \(A(0)\) to \(A(3)\).

Since the digit must be stored in the string as an ASCII character, the upper four bits must contain 0011. That is, for example, the ASCII character 34 H corresponds to the number 4.

Fig. 1 shows that this has been accomplished by handwiring bits \(A(4)\) and \(A(5)\) to +5 volts and bits \(A(6)\) and \(A(7)\) to ground. The remaining digits are accessed after the first digit in sequence. The strobe read by STB(B) occurs only for the first digit.

The differentiated strobe puises from the remaining digits are ORed using the simple diode OR gate, D1-D5. The output of this gate is read at \(\operatorname{STB}(A)\).

Steps 700-730 check bit 3 of Port \(C\) to determine if \(\operatorname{INTR}(A)\) has been set high and loop until it is. Once this interrupt request has been set high, it signifies that the data from the next digit has been loaded into Port A. The program jumps back to DVC to check the decimal point and read the digit.

The instruction DJNZ DVC not only executes this jump, but also decrements the \(B\) register. Once this register reaches zero, all of the digits have been read and the program proceeds to step 740.

Steps 740-780. If the DVM was set to 20 megohms, then the decimal point has not yet been loaded into the string. Bit 1 of the \(C\) register will still be high since step 640 was never executed. This is checked in steps 750 and 760 and, if necessary, the decimal point is loaded into the string in steps 770 and 780 .

Steps \(790-810\). The string must be terminated with either a zero or a comma. Since the appearance of 0 in the string causes the BASIC interpreter to think that the end of the line has been reached, the comma, 2 CH , is stored in the string in step 720 as the last byte.

Steps 820-870. The BASIC program can make little use of this string of characters that has been stored in the string. Moreover, Radio Shack does not really tell you how to return the value of the reading to the program. It would be possible to obtain the value by finding the address of the stored string using VARPTR and then PEEKing at the addresses to obtain the value.

But, astonishingly, the single (or double) precision conversion subroutine located in the operating system does all the work. Since only five digits are involved here, single precision is sufficient. It is first necessary to point the HL register to the start of the string in steps 830 and 840. Then, the subroutine needs
to know that this is a string, not an integer or double or single precision number, and steps 850 and 860 load the number 03 into memory location 40AFH for this purpose. Step 870 calls the routine at \(0 E 6 C H\) in ROM which converts the string into a single precision number. Were it necessary to convert this string into a double precision number, the program would call \(0 E 65 \mathrm{H}\). The remainder of the subroutine restores the registers and returns to the main BASIC program.
If the subroutine has been called by the statement \(\mathrm{X}=\) USR(0), then \(X\) will equal the single precision value of the number read by the voltmeter. The BASIC program needs only to know that the readings are in volts, milliamperes and kilohms. Reading the Level II manual gives no hint that a single precision number can be returned in this way. If anything, the implication is that only integers can be returned. Nevertheless, a single precision floating point number is returned.

\section*{Using the Program}

There are two major advantages to the interface as con. structed here. The first is that the TRS-80 truly becomes a scientific instrument capable of storing and analyzing data, while allowing programs to be written in a high level language.

By imbedding the subroutine into BASIC, the major portion of the program can be written in BASIC which has all of the virtues of a high level language in the ease of displaying data, writing strings, and creating programs.
The second advantage is related to the first. By writing the subroutine as a string in a BASIC statement and storing the entire program on disk or tape, it may be accessed at any time for use by another program that you may be writing.

A library of subroutines such as the one described here may be prepared not only for reading data from digital voltmeters, but also for reading analog-todigital converters, executing visual displays or even performing mathematical iterations.

\section*{A residential heating and insulation analysis.}

\section*{Cold Comfort}

Dan Keen
Dan Laughlin
Rd 1, Box 432
State Highway 83
Cape May Courthouse, NJ 08210

A
rmed with a few facts about your home, this program for the Level II will determine how much money you spend a year on heating, what the size of your heater should be, how much you
can save if you add more insulation and how many years until the cost of the additional insulation pays for itself. It is a simple program with fairly accurate results.

\section*{Using the Program}

First the programs ask the delta temperature in Fahrenheit for your area, which is the average maximum difference be-
tween inside and outside temperatures.

Next, you are asked to input
therms. To arrive at this figure you must use the chart which is displayed on the screen and in-

FIRST ANNUAL COST \(=\$ 1800.27\)
NEW ANNUAL COST \(=\$ 1701.74\)
ANNUAL SAVINGS \(=\$ 98.52\)
WHAT WAS THE COST OF ADDITIONAL INSULATION? 300.00 IT WILL TAKE 3.045 YEARS TO PAYBACK THE COST.

put the efficiency of your heater and the number of degree days. Your meter man should have both of these figures.

Locate the number of degree days on the \(Y\)-axis of the chart. Now move to the right until you hit the curve with the percent efficiency of your heater. Note the number on the X -axis (from 1 to 8) and use it to ENTER THERMS.

The area and thermal resistance (R) of the floors, walls, windows, doors and ceilings are entered. Typical \(R\) values are: 11 for \(31 / 2\)-inch standard fiberglass insulation; 19 for 6 -inch standard fiberglass insulation; two for storm or insulated windows and doors. Exact values should be obtained from local building suppliers.

To account for cracks and openings that allow warm air to escape, heat load is calculated using 10 percent for the infiltration factor. It is assumed that this is a standard house of average quality construction, with evenly dispersed windows and no solar aid. The heat load figure represents how much heat you must put into the home to maintain the delta temperature inside.

To find the annual heating cost, you are asked what kind of heat you have. Type O, E or G, but do not hit ENTER. Respond to COST OF FUEL in dollars, such as .85 rather then \(85 ¢\) per gallon.

To computer the money saved by adding insulation and the number of years for the investment to pay for itself, the program will again ask you areas and \(R\) values. This time you will enter adjusted \(R\) numbers at the locations where you want to add extra insulation.

\section*{Modification}

A sample run follows. The chart is not shown which appears in the program at ENTER THERMS.

In Sample Listing 2 the computer again asks for areas and thermal resistances for ceiling, floors, etc. This time let's change the \(R\) value in the ceiling to 30 to represent an addition of insulation.

\title{
ғ о Р PDGRAMMA HI-RESOLUTION GRAPHICS FOR THE TRS-80*
}

LOWER CASE
The 80-GRAFIX board includes two sets of lower case characters at no additional cost.

DEMONSTRATION PROGRAMS
The 80-GRAFIX board is supplied with a Character Generator software and several demonstration programs.

FINALLY, AT LAST. .
HI. RESOLUTION GRAPHICS is available for your TRS-80 computer system. The 80-GRAFIX board from PROGRAMMA International, Inc. gives your TRS-80 high resolution capability that is greater than the Commodore CBM/PET or even the revered APPLE II.
80-GRAFIX gives the TRS-80 an effective screen of \(384 \times 192\) pixels, versus the normal \(127 \times 192\) for the TRS-80, \(80 \times 50\) for the CBM/PET, or the 280 192 of an APPLE II. As an added feature, 80-GRAFIX offers you lower case characters at no additional cost. Of course, you ian also create your own set of up to \(\mathbf{6 4}\) original characters using the supplied Character Generator software.
The 80-GRAFIX board is simple to install (note that this voids your Radio Shack warranty), and programming is done through BASIC. 80-GRAFIX opens up a whole new realm of software development and excitement never dreamed of for the TRS-80!

REAL-TIME GRAPHIC GAMES
With the 80-GRAFIX board you can write exciting real-time games using BASIC.

EASY INSTALLATION
The 80-GRAFIX board is simple to install and fits inside the TRS-80 case.

80-GRAFIX HI-RESOLUTION
Finally, the only means to protect your computer investment is to order an 8O-GRAFIX board TODAYI

INVERSE VIDEO
The 80-GRAFIX board allows you to do inverse video to high-light your screen displays.

CHARACTER GENERATOR
The supplied character generator software allows you to create your own character set of up to 64 original characters.

GRAPHICS GALORE
The 80-GRAFIX board and the supplied Character Generator allow you to become an artist.

EXCITEMENT \& FUN
Open up a new realm of software development with the 80-GRAFIX board.

\title{
An inexpensive hardware mod for those who want both Level I and II capability.
}

\title{
Two BASICs Are Better Than One
}

\author{
Allen W. Erickson \\ 13868 Far Hills Lane \\ Dallas, TX 75240
}

If you are contemplating an upgrade of your TRS-80 Level I to Level II BASIC, you're probably also wondering what to do about all the Level I programs you've accumulated or written.
If you already own a TRS-80 Level II, you may be wondering how you can run Level I programs on your machine. A quick look through 80 Microcomputing and other personal computing magazines reveals a great many Level I programs that have not yet been converted to Level II and perhaps never will.

You can rewrite the programs yourself, but that's too much work. Besides, you may not have
the source listings. And it's not very practical to change the Level I and Level II ROM chips every time you change programming languages.

\section*{The Switch Between}

The obvious solution to these problems is to have both Level I and Level II BASIC installed in your machine, with some means to switch between them. Such modifications have been published before, but in every case I've seen, the mod required printed circuit trace cutting, piggyback components, wire unsoldering and resoldering, etc.

The modification described here requires absolutely no alterations to the CPU board and, if you have the single-chip BASIC I ROM, less than five dollars in parts.

A note of caution: This mod will work only with the singlechip BASIC I ROM and CPU boards with separate chip select lines to pin 20 of the two ROM sockets (Z33 and Z34). Some early TRS-80s may not have separate lines. If in doubt, check with your dealer.

If you are upgrading your Level I machine to Level II, be sure to keep the Level I BASIC ROM. If you already have a Level II machine or your Level I ROM
has two chips, you will have to acquire the single-chip ROM. My dealer quoted a price of \(\$ 29.95\) for the chip.

If you are familiar with digital logic, the following paragraphs will help you understand the logic behind the modification. I also highly recommend that you get a copy of the TRS-80 Technical Reference Handbook (Radio Shack Catalog No. 26 2104). It's well worth the \(\$ 10\) for anyone interested in the hardware side of microcomputing and do-it-yourself maintenance.

\section*{Theory}

Most of the ROM and RAM addresses and peripheral devices in the TRS-80 are selected by memory mapping. That is, each device is assigned addresses in the 65 K range of possible memory addresses for the Z-80 CPU. For example, the Level I ROM occupies address spaces 0000 H through OFFFH. Level II ROM occupies 0000 H through 2FFFH. RAM is allocated to 4000 H through FFFFH.

Addresses 3000 H through 3FFFH are used to map TRS-80 peripherals, including the display ( 3 COOH through 3 FFFH ) and keyboard \((3800 \mathrm{H}\) through 38 FFH ). There's a lot of unused address space in this range and,
someday, I'm going to figure out a use for it.

In order to select the appropriate 4 K segments of address space, the TRS-80 uses a three line to eight line decoder (Z21 in Fig. 1) to translate the most significant hex digit of the address (bits A12-A15). The 3 translation is used on the CPU board for peripheral device selection. The remaining seven translations are fed to a 16 -pin DIP socket (X3), which is used for memory mapping.

Plugged into socket X 3 is a programmable DIP shunt. The DIP shunt is nothing but shorting bars between pins 1 and 16, 2 and 15, etc. To program the DIP shunt, you merely break the appropriate shorting bars, resulting in an open circuit.
The "outputs" of the DIP shunt are ROM A*, ROM B* and RAM* (the * is Radio Shack's way of indicating a logical NOT or active-low condition). ROM \(A^{*}\) is used as a chip select line to ROM socket Z33 and ROM B* as a chip select line to ROM socket \(Z 34\).

RAM* is used to select the onboard RAM sockets and covers the address range 4000 H through 7FFFH. Memory addresses 8000 H and above are off-board (i.e., in the expansion

interface). Note in Fig. 1 that A15* AND RAS* (row address select) are used to enable all onboard memory translations.

ROM A* (pins 7 and 8 of \(X 3\) ) is used in a Level II machine to select the outrigger circuit board containing the Level II BASIC ROM chips.

If you follow the wiring of the DIP shunt in Fig. 1, you will see that ROM \(A^{*}\) is low (active) for translations of 0,1 or 2 . ROM B* is also low in this configuration, but not necessary for Level II ROM selection.

By now, you can probably see the necessary changes taking form. If the single-chip Level I BASIC ROM is in socket Z34, and we can somehow change the programming of the DIP shunt 0 translation to ROM \(A^{*}\) or ROM \(B^{*}\) at wil!, we have all the necessary ingredients.

We don't have to worry about the 1 and 2 transiations, since they will always select ROM \(A^{*}\) (i.e., Level II ROM), and the Level I ROM will never reference addresses in that range.

\section*{Modification}

Assuming that you have the single-chip BASIC I ROM, the only other parts you will need are a SPDT switch, a 16 -pin DIP header (Radio Shack Catalog No. 276-1980) and three pieces of flexible hook-up wire six to eight inches long. Any SPDT switch, such as a good subminiature toggle switch (Radio Shack Catalog No. 275-613), will do. I used a three-strand ribbon cable for the wire.

Fig. 2 illustrates the wiring of the DIP header and switch. The
procedure is as follows:
1. Cut three six to eight-inch pieces of hook-up wire or ribbon cable. Trim \(1 / 4\) inch of insulation from each end and tin the leads.
2. Connect one lead (center of the ribbon cable) between pin 10 of the DIP header and the center pole of the SPDT switch. Solder both ends.
3. Connect one lead between pin 6 of the DIP header and one of the remaining SPDT switch poles. This is the Level I position. Solder both ends.
4. Connect the last lead between pin 9 of the DIP header and the remaining SPDT switch pole. This is the Level II position. Solder the switch end only.
5. Connect a wire jumper between pins 8 and 9 of the DIP header. Solder both ends.
6. Connect a wire jumper between pins 7 and 11 of the DIP header. Solder both ends.
7. Connect a wire jumper between pins 2 and 15 of the DIP header. Solder both ends.
8. If you have a 16 K machine (or larger), connect wire jumpers between pins 3 and 14, 4 and 13, and 5 and 12. Solder all ends.

This completes wiring of the DIP header and switch assembly. Now, on to the installation: 9. Disconnect all cables to the keyboard unit and lay it upsidedown on a nonmarring surface. Remove the six Phillips screws in the bottom.
10. Holding the case top and bottom together, turn it over and carefully lift off the top. Be careful of the power-on LED.
11. Carefully raise the keyboard assembly and fold it back. Do not strain the interconnecting

Fig. 1. Memory Mapping in the TRS- 80 Level II.

\section*{4 MHz TRS-80*} MODEL I UPGRADE PLUG COMPATIBLE PROCESSOR
- DOUBLES PROCESSING POWER of Level I and II by increasing speed 2.25 times to equal Model II.
- RELIABLE 4 MHz OPERATION USES Z-80A - not a mere clock speed up.
- EASY TO INSTALL - plugs into expansion port.
- COST EFFECTIVE - costs less than 5\% of typical system price.

\section*{The Original GREEN-SCREEN}

The eye-pleasing Green-Screen fits over the front of your TRS-80 Video Display and gives you improved contrast with reduced glare. You get bright luminous green characters and graphics like those featured by more expensive CRT units.

Don't confuse the Original Green-Screen with a piece of thin film stuck to the face of your video tube, such as that advertised by others. The Original Green-Screen is mounted in a full frame perfectly matched to the color and texture of the TRS-80 Video Display. It is attached with adhesive strips which do not mar your unit in any way.

The full frame design of the Original Green-Screen "squares off" the face of your video display and greatly improves the overall appearance of your system.

THE GREEN-SCREEN.

\section*{HI-RESOLUTION GRAPHICS FOR TRS-80*}

INTRODUCING: E/RAM

E/RAM Graphics is a unique hardware/software package, which will integrate highspeed, high resolution graphics into any Level II TRS-80 system. E/RAM hardware is a fully plug-compatible box, which installs in minutes, and requires absolutely no modifications to the TRS-80 system. E/RAM software is a compact, relocatable set of utilities which provides the user with easily accessible graphics functions. For instance the user pokes the end point coordinates of a line into certain locations, does a USR call. and an optimized dot-raster line is automatically drawn on the screen at very high speed (less than 10 milli-seconds for a medium length line).
E/RAM does not require the purchase of an additional monitor CRT. The high-resolution graphics video is syncronized with the TRS-80 video and appears on the screen with the normal TRS-80 display. Alphanumerics. TRS-80 graphics, and E/RAM high-resolution graphics may be displayed simultaneously or individually.
E/RAM hardware contains its own 6144 byte video memory. which provides a true 256 x 192 matrix of independent graphic elements. (E/RAM is NOT a programmable character generator type graphics system. Character generator systems have serious limitations in full screen graphics applications.)
E/RAM will operate with or without an expansion interface, and with any standard memory configuration ( 4 k through 48 k ).
E/RAM is last. "E/RAM" is an acronym for Extended Random Access Memory, a very short description of the Patent-Pending method of \(1 / 0\) employed by this device, which gives it memory-mapped speed without interfering with the memory space used by the TRS-80.

The installation of E/RAM will not affect normal operation of the TRS-80 High resolution ON/OFF is under program or manual control (a switch is provided). An expansion card edge connector is provided so that other peripherals may be used on the TRS-80 bus.

E/RAM software package is compact (less than 1000 bytes), fast, easy to use, and very flexible. A relocating loader is provided. The user can delete unneeded routines if more memory space is required. Lines can be drawn as fast as 13 per second using BASIC USR calls, and as tast as 200 per second using assembly language programs
Routines usable through USR of BASIC, and of course an assembler CALL are:
\begin{tabular}{ll} 
INIT & - Sets up display \\
PLOT & - Plots a point \\
READ & Reads a point from the screen \\
BLACK & - Sets drawing mode to black (off) \\
WHITE & - Sest s drawing mode to on \\
CLEAR & - Clears the high-resolution graphics screen \\
LINE & - Draws a line
\end{tabular}

As an example, after the utilities package is loaded and you desire to draw a line, the following sequence of BASIC instructions could be executed:
\(\mathrm{U}=\mathrm{USR}(0) \quad\) Return the communications area POKE \(\cdot \mathrm{U}+1, \mathrm{XO} \quad\) Provide the beginning X coordinate
POKE \(\mathrm{U}+3\), YO Provide the beginning \(Y\) coordinate
POKE \(U+5, \times 1 \quad\) Provide the ending \(X\) coordinate
POKE \(U+7, Y 1\) Provide the ending \(Y\) coordinate
\(V=U S R(4) \quad\) Draw the line (Current speed is approximately 13 vectors/second)
The complete E/RAM package is available for only \(\$ 349.95\), and includes case. power supply, cables, software cassette, and complete documentation
To order, or for further details, write or call:

\section*{THE SOFTWARE DIRECTORY}

A Comprehensive Guide to Programs
Now, you can have access to hundreds of computer programs, quickly and easily.

The Software Directory lists available programs for major home and small business computers, including Apple...Atari...North Star...Radio Shack...PET...CP/M Systems and more.

Indexed for fast and easy reference, Directory categories include games, education, utilities, home accounting, and professional business programs. It's organized according to computer type, so you can find the programs designed for your computer, fast.

The Software Directory describes each program, and lists the minimum required system, program price, ordering information and vendor address.

The Software Directory has all the information you need for ordering any of the hundreds of software programs available. To get it, send a check or money order for \(\$ 9.95\) to Software Central. We'll send you a software reference book you'll use time and again.

Software Central
P.O. Box 30424 Dept. M

Lincoln, NE 68503
ribbon cable.
12. Remove the five rubber separators. Remember where they were.
13. Carefully remove the CPU logic assembly together with the keyboard assembly and turn them over to the component side.
14. Remove the DIP shunt at \(X 3\) (near the expansion interface edge connections) and plug the DIP header/switch assembly in its place. Make sure it is plugged in correctly.
15. If the ribbon cable from the Level II board is plugged into socket Z34, carefully remove the plug and insert it into socket Z33.
16. Make sure the single-chip BASIC ROM is positioned correctly and carefully insert it into socket Z34.
17. At this point, you'll have to decide where and how to mount the SPDT switch. I drilled a hole near the center of the rear apron of the case. Make sure the wire will reach the switch position when the PC board is reinstalled in the case.
18. You may want to check out the computer before replacing it in the case. See Checkout and Operation.
19. Reassemble the unit by reversing the above procedure, installing the switch as you go. Be sure that the five rubber separators are on the posts under the keyboard assembly. If you mixed up the screws, the shortest ones go in the holes near the front of the keyboard, the mid-dle-sized screws in the two center holes and the long ones in back.

\section*{Checkout and Operation}

Connect the power supply and display cables. Put the switch in the Level II position and turn the power on. The video should display:

> MEMORY SIZE?

If the display is:

> READY
the switch is in the Level I position.
If the display is garbage, turn the power off, wait a few seconds and turn the power on again. If the display is still garbage or clear, turn the power off and recheck all your wiring. Make sure the DIP header, BASIC I ROM chip and ribbon cable connector from the Level II board are properly oriented in their sockets.
Now, turn the power off and switch to the other Level position. Wait a few seconds and turn the power on. The display should now be the alternate initial message. If Level II worked but Level I does not, the problem is likely in the Level I ROM chip, its orientation or the wire from the Level I position on the switch.
You'll have to turn power off each time you change levels. If you just throw the switch, the CPU usually goes out to lunch. The manual reset won't recover.
The reason for pausing each time you turn the power off and on is to allow time for the poweron reset capacitor to discharge.

Fig. 2. Switch/Header Assembly.

Genetic counsel from your TRS-80.
}

\section*{Genotype}

\author{
Albert Rauber M. D. Department of Pediatrics 69 Butler St., S. E. \\ Atlanta, GA 30303
}

Prospective parents faced with genetic problems must make their own decisions. Only they can balance the risks and benefits of pregnancy, abortion, contraception, sterilization or adoption.
Their physician will often tell them what the odds are that a child would have a particular birth defect or would carry the trait. But these statistics come from large samples, and can be misleading. No woman will have enough pregnancies in her lifetime to demonstrate the odds.
This program gives the patient a more realistic view of probability as applied to human genetics. It uses four examples: -The general inheritance of an autosomal recessive gene that requires a contribution from each parent. ("Autosomal" refers to chromosomes other than those that determine sex.)
-Hemophilia, which illustrates the workings of a gene carried on the special chromosomes that determine sex.
-Sickle-cell disease, which differs from other autosomal recessive genes in that we can test for it even when it causes no
disease.
-The four major blood types, which are combinations of two genes, each of which expresses itself as a single gene and neither of which may be present.

The program is written on a TRS-80 Level II in BASIC and runs on 16 K . It comprises 8357 bytes.

\section*{The Program}

Statements 300-360 select topics from a menu. 1000-1200 pick the genotypes of each parent for the recessive inheritance example.

1210 sends the program to 20000, a subroutine to print and label a conventional pedigree tree. A second branching at 20040 and 20070 goes to subroutines at 30000 , which fill in the male and female symbols to indicate affected or carrier states.

20302 defines the number of children to be born. 20305 combines the parents genotypes, and branches to appropriate lines. 20307-20329 calculate the probabilities using the random number generator. 20332 counts the children, and 20329 determines sex.

20334 branches to a subroutine that defines the \(x, y\) coordinates for printing the next child on the family tree. Line 20440 directs the program to graphic subroutines, which print the symbol appropriate to sex and genotype (30018-30450).

Line 20470 lets you repeat the experiment or return to the menu.

The other examples use the same graphics subroutines but differ in their calculations.

The hemophilia ( \(x\) linked recessive) program considers only two genotypes ( G ) and the two sexes (R), which are determined by serial RND (X) statements to produce four different outcomes in lines 2130-2160.

The blood type example, beginning at line 3000 , uses string functions, since blood type names are actually concatenations of the gene names ( \(A, B, O\) ). Although sex has nothing to do with the inheritance, l've kept the symbols and terms to enhance realism.

Line 3010 summarizes a basic information review. Lines 3110-3170 ask for the paired
genes of each parent. Lines 3250-3210 randomly select which gene each parent will furnish to the conceptus (C\$) in line 3320.

Lines 3330 and invoked subroutines print and label the family tree, with genotypes for the blood groups.
The sickle-cell routine at line 4000 follows the same basic pattern as the blood group routine, but with different text.
Repeated runs compress time and let you simulate many families of varying sizes, giving a more accurate feel for the odds and stakes involved.
Biology teachers can modify this program for classroom use by removing the medical references and using sweet pea flower colors, guinea pig coat markings or other characteristics.

\title{
Omikron's Mapper + NEWDOS/80 8" Drives for the TRS-80
}

NEWDOS/E0 is Apparat's latest upgrade to NEWDOS. Features include variable length records, chaining, and drivers specifically configured for Omikron's MAPPER II. \$150.

MaPPER II adapts the TRS-80 to run both 5 " and \(8^{\prime \prime}\) drives. With NEWDOS/80, storage is increased to 300 K per \(8^{\prime \prime}\) drive. \(\$ 99\) plus \(\$ 10\) per cable connector.

MAPPER I adapts the TRS 80 to run the vast library of CP/M software as well as the TRS-80 software. All Lifeboat Software may be ordered for the MAPPER I. All MAPPER I CP/M software is compatible with the CP/M for the Model II. With MAPPER II and \(8^{\prime \prime}\) drives, the Model I becomes disk compatible with the Model II.

Standard features include lower case support, serial and parallel printer drivers, and an addressable cursor. MAPPER I is supplied with complete utilities including a memory test, a disk test, a copy program, and a proprietary program for converting TRS-DOS files to CP/M files. \(\$ 199\).

WORD PROCESSING - MAPPER I supports professional word processors like the Magic Wand and Word Star (see reviews in June 80 Kilobaud). Omikron's implementation includes a blinking cursor, auto repeat, shift lock, debouncing, and an input buffer that eliminates missed characters. Magic Wand super discount price \(\$ 299\).

FIEID PROVEN DESIGNS - After one year of MAPPER production, Omikron has established an impeccable reputation for reliability, integrity, and user support. Omikron's customers include the US Government, major corporations, universities, medical doctors, and professionals in all fields.

SYSTEMS-Omikron sells complete systems featuring Model II compatible Shugart disk drives. Call for prices and delivery.

FOREIGN ORDERS must include full payment in US funds plus \(\$ 25\) for air shipping and handling.

See reviews in July 80 and August 80 BYTE By Jerry Pournelle.

Our model CS-2 interface plugs into the Qume printer I/O and offers a centronics connector for DIRECT CONNECTION from your TRS-80 parallel interface.
Q. Which Qume?
A. Any sprint 3 series printer 35, 45, or 55 CPS.
Q. Software compatability?

\section*{Hear it with an RS-232 Interface Board.}

\section*{The Serial Clank on the Printer}

\author{
William O'Brien \\ 11 Dongan Place \\ New York, NY 10040
}

\section*{LIST_-}

How many times do you type that word, hit return and watch as the lines zip past your eyes, and prepare to press both the © and shift keys at the same time, trying to stop the speeding display at the line you think you want?

Either you pass the line or you stop the listing with the line so close to the top, it clears off when you press the break key. If you're at all like me, your video display blushes at the string of epithets that follows.

Neon signs go off in your mind: hard copy, printed output!

\section*{The Serial Interface}

Now you find yourself thumbing through your favorite microcomputing magazine and you see some ads for a GE terminet or a Teletype 33 or your friend Hubert is ditching his Model 99 Geodeisic impact printer. Upper and lowercase, plain paper. Not bad. The prices are only about \(\$ 200\) to \(\$ 500\). Great! But it needs a serial interface. Well, that kills that, right?

Maybe not. You don't have to settle for a second-hand printer just because it says "designed for the TRS-80" or is made by Radio Shack.
If you think back a moment to the last time you drooled over items for your machine in a computer catalog, you might remember seeing an ad for something you don't see Radio Shack sell for its TRS-80 very often: a board full of parts. An RS-232 serial board to be specific.
"Run a modem/serial printer from your TRS-80!" Good, no switching plugs on the parallel port; you can even use that sec-ond-hand printer! And it does work. But although serial output for a printer is not that hard to come by from the TRS-80, it's not all that easy either. Let's take a quick look at serial data transmission in general before we get on to Radio Shack's solution.

Normally, data is sent to the parallel port and out to the printer in this fashion:

Data bits are sent simultaneously with the appropriate status signals between the device and the CPU, all coded in binary form with 3.5 volts or more as a 1 and 0.8 volts or less as a 0 . Data transfer is relatively straightforward and at a fairly good speed. Sounds like a good idea, right?

Ask for our complete catalogue!

But suppose we want the receiving device to send some information back to the CPU? That means we need seven-plus lines out and seven-plus lines back in. That isn't so hard to imagine, except if you assume that the internal device is not in the same room as the CPU, or even in the same city, for that matter. Everyone knows that for that type of distance you use a modem, a device that codes binary output into two tones, one representing the 0 , the other the 1. But, if parallel transfer mode is used that means we'll need seven-plus phone lines; hardly convenient or economical.
Serial data is transferred as in Example 1.

Obviously, for communication purposes at least, serial transmission format has a large advantage. Only one line is needed for data out and one for data in; a single phone line. As far as devices immediately available, hardwiring is only needed on a maximum of four lines: data out, data in, ground and, if necessary, DATA SEND READY, a status line that signals whether the device is free for data reception or busy.

It appears that forming serial data out of parallel is not that difficult a problem. All we must do is collect the parallel bits, line them up, add the appropriate start, stop and status bits, and re-transmit the data all in a row. Well, almost.

\section*{Different Types of Data}

It seems that there are two different types of serial data. One is called TTL serial, and it follows much the same pattern as we described above: Parallel data stored and re-transmitted with added extras. However, standard RS-232 devices are a little more choosy about what type of signals they'll accept. Unfortunately, ordinary TTL levels are not quite good enough.

Instead, an RS-232 device requires -3 volts or less to indicate a 1 and +3 volts or more for a 0 . This means that in addition to reforming the signals leaving the CPU, the interface must also transform them into the proper voltage levels neces-

Listing 2. The revised program to relocate the driver routine to the top of 32K. The actual addressing is done in line 40. This listing incorporates the change in data values mentioned in the article.
sary for the receiving device to understand them.
As if that isn't enough, different devices may operate at different data transmission speeds (called "baud rates"), which normally range from 110 to 9600 depending on the function of the device.
That's where the RS-232-C comes in. This is the board Radio Shack produces for the TRS-80 that not only provides standard EIA serial level signals, but also provides 110, 150, \(300,600,1200,2400,4800\) and 9600 baud, which are directly programmable via a series of switches in a miniDIP arrangement. Other baud rates may be obtained by POKEing different values into the BRG (Baud Rate Generator).

Odd or even parity, no parity, as well as the number of stop and data bits, are also programmable by means of the switches. Just have a tiny screwdriver, or better still, a sharp pencil, handy.

If you are installing the board yourself, be mindful that the newer expansion interfaces are not equipped with a 44-contact edge connector which mates to the serial board. This pinout will be installed by the Radio Shack technician when he installs your board for you.

You're welcome to try to avoid the charge for this (I think its \(\$ 7.50\) ) but you will void all warranties on your E/l.

All right, you've installed your board and connected the cable between the expansion interface and the serial printer of your choice. You turn your machine on, load a program and type in LIST. Hit ENTER.

The RESET button is on the left rear portion of the CPU by the Ell connector, in case you've forgotten in the excitement.

\section*{WHATHAPPENED???}

What happened is that the RS-232 board is designed to be used with a modem in mind and Radio Shack's little blurb about a printer, while not invalid since the output is genuine RS-232, is not exactly all-inclusive.

You can't simply connect the device and LPRINT your heart out. Down deep in the memory of your CPU, at locations 4025,

4026 and 4027 (hex) are the pointers that remind the CPU that it has a parallel printing port, and when it hears someone say L-anything, the output goes to that port. If no printer is there, everything hangs up. It's easy to surmount the difficulties, but let's start with first things first.

\section*{Check Your Silde Switch}

Assuming you have installed the board correctly and set the baud rate and parity switches as necessary, make sure that the slide switch is not in the position marked TERM as the owner's manual suggests.

The reason for this is that the instructions in the manual are primarily for using your TRS-80 as a terminal. As such, data is transmitted over Pin 2 of the DB 25 connector and received via Pin 3.
This is appropriate since, as a terminal, your TRS-80 will be receiving data and the standard pin for data reception is Pin 3.

However, your printer wants its data sent to it on Pin 3. With the selector slide switch in the COMM position, the functions of the two pins are reversed. All right, we have data in the correct place. Don't try the LLIST experiment again just yet, there is more.
Those three addresses that control the printing have to be altered and a new driver routine placed in memory so the CPU will output to the correct place.

The driver program loads in at \(7 F O 0 H\), which is decimal location 32512 (line 40, the first POKE address). This location is right at the top of 16 K of memory. You use 32511 (one byte below the loading point of the program) in response to the MEMORY SIZE_query.

My TELPAR thermal printer reacts to this instruction set correctly. However, I have a 32 K system; loading an 18 K program under DOS wipes out the driver program. It must, therefore, be moved up to the top of my mem. ory where it will be safe.

To make things easy, it should be moved up a full 16 K . This will place it at the top of a 32K machine. This means that it must go from 7FOOH to BFOOH. (Each increment of the leading
hex digit increases the value of the memory address by 4 K since it's in the \(16^{3}\) column. So, to move it 16K, we will have to increment it four times - 8F00, or \(20 \mathrm{~K}, 9 \mathrm{~F} 00\), or \(24 \mathrm{~K}, \mathrm{AF} 00\), or 28 K , since the highest hexadecimal numeric value in a single position is nine with the letters A-F being used as ten through 15; and finally BFOO or 32 K ).
You will notice that line 20 of the original program supplied by Radio Shack contains three POKE statements. They change the values in memory locations \(4025 \mathrm{H}, 4026 \mathrm{H}\) and 4027 H . We can concern ourselves primarily with the last two of these, POKE 16422 and POKE 16423.
POKE 16422 puts the value 0 into that particular memory location (4026H) and POKE 16423 puts the value 127 (into 4027H). These two memory POKEs tell the CPU where to find the driver routine. There is a strange thing about loading a memory location. You load the least significant bytes (the last two digits) first and then the most significant bytes (the leading two digits).

We are telling the machine that the driver program is located at 127 (7F in hexadecimal, since \(7 \cdot 16\) plus 15 , \(F\) in hex notation being 15, equals 127), 0 (or 00 to complete the four column hex notation). In other words, go to memory location 7F00 and there you will find the driver routine. That was fine when we used the original program, but we've moved it. God only knows what we'll find at 7FO0 now!

Remember, we moved the routine up an even 16 K to BFOO, where we want the CPU to find it. Keeping in mind the backwards loading of the address, POKE 16422 can remain as 0 , the last two digits are still 00. Only the 127 will have to be changed. Since BF equals \(11 \cdot 16\) ( \(B\) is hex notation for 11) plus 15 , POKE 16423 will now use the value 191.

And, if you happen to look at the data statements, you'll notice a few other 127s. Just as you surmised, they also tell the CPU to go and/or get something from a location in the old 7F range. These too must be changed to 191. If you look over
the two disassemblies of the memory locations affected by the two BASIC programs, you'll notice the difference.

We also must change the locations that the data is POKEd into. Line 40 must now read:

40 FOR \(X=-16640\) to -16568

How, you may ask, can we POKE a value into a negative location? Actually, we don't.
BFOO is memory location 48896 decimal. The trouble is that the TRS-80 does not recognize an integer over 32767 (which, unfortunately, is the end of 16 K of memory). To determine the decimal value to POKE into, we take the actual decimal value (48896 for BFOO) and subtract 65536 from it (that's the decimal address for 64 K of memory +1 .); the resulting negative number is recognized as a valid memory address. However, the MEMORY SIZE_ question should be answered with 48895, one below the actual starting address of
the routine.
The same thing would be done if we had moved the routine to the top of 48 K of memory ( FFOOH ), incrementing accordingly (instead of 127 or 191 we would use 255, 15*16 plus 15).

\section*{Clunk Away Happily, Hopefully}

If, after all of this, your printer doesn't clunk happily away, first make sure the TERM/COMM slide switch is really in the COMM position, the baud rate, parity and data bits are set correctly and you've turned on the E/I, then call (800) 433-1679. That's Radio Shack's toll-free Computer Services number. They will fill you in, if they happen to have any data about your specific printer application.

That's most of the pitfalls I've found in using the RS-232-C for printer output. Hopefully, it won't dissuade you from buying it. Only a small investment would then separate you from a modem and then, possibly, time sharing. And the sky's the limit. We might even wind up "talking" one day via our machines.

\section*{1. BUSINESS PROGRAM PACKAGE}

13 Business programs (e.g., capital budgeting, cashmanagement, ratio analysis, debt management). These programs will be very useful to the business manager. (Price \(\$ 200\) )

\section*{2. PROCUREMENT PROGRAM}

Ascertains purchase amount when future price of commodity is varying. A must for all managers who have purchasing responsibilities. This program takes into consideration inventory levels, inventory capacity, and financial carrying cost in determining the optimal amount of an item to purchase when future prices are varying. (Price \$150)

\section*{3. PROFORMA CASH-BUDGET \\ PROGRAM}

Allows the user to project the cash-balances for up to twelve periods in the future. Amount of loan, if needed, is computed as well as computing funds available for short-term investment. (Price \$125)

\section*{4. LEASE-PURCHASE PROGRAM}

Evaluates the lease vs. purchase decision incorporating all the latest tax laws including the investment tax credit and accelerated depreciation. This program gives the user all the information necessary to make this decision. (Price \$50)

\section*{5. COLLEGE ENROLLMENT}

Forecasts the enrollment for colleges using several different statistical techniques. User can specify the number of periods for which a forecast is desired. (Price \(\$ 100\) )

Extensive Documentation With Each Program All programs on disk and require at least 32 K of memory. Write or call for a brochure which describes the product in greater detail.

\section*{Find the hidden word.}

\title{
Puzzler
}

James P. Morgan
2386-B Ash Creek
Scott AFB, IL 62225

The popularity of word finder puzzies is widespread. They appear daily in most metropolitan newspapers and monthly in a variety of puzzle magazines.

The following program presents one method of creating these popular pastimes with your TRS-80 or another micro with a compatible language structure. The program is written in Level II and requires 16 K memory.

\section*{Program Operation}

After loading from tape and entering RUN, a brief explanation of the game appears on the video. While the user reads this information, the computer forms a \(12 \times 19\) array of random letters and specific words selected from a data bank, inserting them into the array, in random order horizontally, vertically, and diagonally. This process takes 20 to 25 seconds.

Pressing any key clears the screen, and the array with the hidden words is displayed, with the eight selected words listed at the bottom of the array.

The player searches through the jumble of letters for one of the selected words. Once located, he types the word and ENTERs on the keyboard.

The program then prompis for the coordinates, vertical and horizontal, of each letter in the word. As each letter is entered, it is compared for a corresponding match-up on the screen, and if correct, the screen is redrawn with that letter missing. If the match is incorrect, the game ends and the program returns to the beginning.
The first bit of string manipulation begins at line 320. The LEN(string) function extracts the number of letters in a given string and returns a numerical value. This value is assigned to the variable N and used for subsequent string manipulations.

Lines 330 and 340 determine in random fashion in what manner to insert the selected words into the puzzie. For example, if the value of \(L\) returns as 1 , line 340 sends the program to subroutine 400, the first option in the line.

Assuming the program jumps to line 400, let's follow the logic of just how the program inserts a word into the puzzie from that point.

Subroutines 400 through 1100 all work in the same manner. At line 410, a starting location is selected at random. Lines 420 through 450 then test to find space to insert the selected word.

Line \(\mathbf{4 2 0}\) sets up a counter which corresponds to the length of the selected word. The next two lines test to find if: (1) the proposed location is outside the confines of the array; and (2) the proposed location is already in
use with another letter.
If the answer to either question is yes, the program goes back to line 410 for another starting point. If all of the proposed spaces are within the array and are unoccupied, the program moves on to insert the word at lines 460 to 490.
The I counter establishes the number of letters to be inserted. The value of the location \(\mathrm{A} \$(\mathrm{X}\) \(I, Y\) is assigned to each letter in turn.

The player continues until he discovers all eight words and removes them from the array. He then opts to continue with a new puzzle or end the game.

Although using the program is quite simple, the programming techniques used to create the puzzle are a bit more complex. I'll present a general outline of the program, followed by a specific discussion of some of the technical aspects in the next paragraphs.

\section*{SO YOU WANT TO USE YOUR TRS-80 TO:}

Relearn French. Help your children with their reading. Teach your entire family to program. But Interaction Is So Awkward In BASIC.

BPILOT IS THE LANGUAGE FOR YOU
BPILOT is a version of PILOT written especially for the TRS-80 with elther Level II or Disk GASIC. PILOT was developed by teachers for Computer Alded Instruction. PILOT allows you to concentrate on the instructional goals, not the computer.

\section*{BPILOT HAS 3 VERY} IMPORTANT FEATURES:
1. BPILOT is a complete PILOT. It includes the eXecute Indirect command, a complete Match instruction, and long labels.
2. You create BPILOT programs using the TRS-80 commands you are familiar with (AUTO, EDIT, LIST, TRON ...). There are no new (and confusing) system commands.
3. BPILOT allows you to use both PILOT and BASIC instructions in your programs. Besides increasing the power of PILOT, this makes it easy to learn PILOT If you know BASIC, and easy to teach your children BASIC once they know PILOT.
BPILOT is a concise assembly language program making extensive use of the Levelll ROilis. On a 4 K system, the Level II version of BPILOT leaves 2 K for programs. On a 16K system, the Disk version leaves 4 K for programs. At \(\$ 24.95\) for either version, including a reference manual and 3 demonstration programs, BPILOT is a true bargain. \section*{How the Program Works}

Lines 10 through 110 print general information concerning the puzzle. As the user reads this information, the program moves on to the computations required to build the structure of the puzzie.
The three arrays used in the puzzle are DIMensioned at line 200. The \(A \$(X, Y)\) array, used throughout, forms the visual display. The C\$(Z) array stores the 50 words, of which eight are selected at random to insert into the \(\mathbf{A S}(X, Y)\) array. The W\$(A1) array stores eight words selected from the \(\operatorname{CS}(Z)\) array. The POKE statement in this line is required for proper execution of the READ function of the TRS-80, Revision \(\mathbf{G}\).

Lines 210 through 250 initially set the \(12 \times 19\) array to a value of empty spaces two columns wide. These empty spaces are eventually filled either by random letters or the specific letters of the puzzie words. Lines 260 through 280 fill the C\$(Z) array with the words from the data bank.
Lines 290 through 350 begin the process of selecting the words and inserting them into the \(\mathbf{A S}(X, Y)\) array. A1 is initially set at 0 and is used as a counter in later subroutines to track the eight selected words. Line 300 selects a random number, which is then used to transfer the word value of that number into the W\$(A1) array at line 310.

The letter is derived from the MIDS function which works as follows: the word is identified by the WS(A1) array which was determined at line 310. The specific letter is found by the next two values in the MIDS statement. \(1+1\) identifies the starting point in the W\$(A1) string, while the last value, 1 , says we only want one letter extracted.

As the I counter increments, the letters are pulled one by one from the selected word and given a consecutive location in the puzzle array. Line 490 keeps track of the number of words inserted, and when the total reaches eight, the program branches to line 1300. Otherwise, it returns to line 300 ,
selects another word and inserts it in the manner I have just discussed.

\section*{Two Loops}

Lines 1300 to 1390 complete the job of filling in the entire AS(X,Y) array. Two loops are used to accomplish this task. As the program increments through the \(\mathrm{Y}, \mathrm{X}\) loops, the test at line 1330 checks each array location for occupancy.

If there is already a letter assigned to a specific location, the program jumps to the next value of \(Y, X\). If the location is empty, lines 1340-1360 fill it in with a random letter.

Since the ASCII codes for the letters of the alphabet run from 65 through 90 , a random number from 1 through 26 , when added to 64, results in a number corresponding to the alphabetical portion of the code. Line 1360 translates that number via CHRS(n), which returns the letter corresponding to the number and assigns it to the \(\mathrm{AS}(\mathrm{X}, \mathrm{Y})\) location.

The array is now complete. It takes about \(20-25\) seconds for the computer to create the filledin puzzle, and at this point the user can see the results by hitting any key. The short routine which accomplishes this task is found in line 1390. For those who have not discovered this powerful tool, a word of explanation is in order.
Line 1390 M\$ = INKEY\$: IF M\$ = "" THEN 1390 works as follows: INKEY\$ tells the computer to stand by, the user is going to enter something directly from the keyboard. If "" (nothing) is input, the statement tells the program to go back to the beginning of line 1390 and wait for the person at the keyboard to do something other than just sit there.

When any key is pressed, IN . KEY\$ assigns the key value to the string variable M\$, and the program moves on to the next line. Simple yet powerful, since it provides the user with instantaneous keyboard control over the program. This function can also be used to advantage with following IF,THEN statements, which can then be used for mul-
tiple choice branching related to a specific keyboard input.

Hitting any key moves the program to the GOSUB routine in lines 1700 through 1800. The array and words are printed and control is returned to lines 1500 through 1600.
Line 1510 selects a word and assigns the string value \(D \$\). Line 1530 extracts the number of letters in the word which will be used in the counting sequence at line 1540. The error statement at line 1530 is a trap which catches a bad input at line 1550 ; for example, a keyboard bounce resulting in a coordinate outside the dimensions of the \(A \$(X, Y)\) array.
The coordinates input at line 1550 are used to select the value of \(A S(X, Y)\), which is compared to the value of E derived from the MIDS function at line 1560 . If the letters match, the \(A S(X, Y)\) value is changed to "", providing positive feedback to the user when the screen is reprinted.
Lines 1900 through 1940 provide the option of ending or going back for another puzzle.

Note the use of INKEYS as a branching device. The DATA is stored starting at line 2000, and the error routine at line 3000 .

\section*{Modifications and Changes}

Everybody loves to play with a program, so l'll offer a few sug. gestions you may want to try. The number of words in the data bank can be increased to whatever point your available memory handles. This version leaves about 9000 bytes available in my 16 K machine, so there is plenty of space for expansion.

The C\$(50) dimension at line 200 must be changed to match the number of words in the DATA file, line 210 has to CLEAR more string storage space, and lines \(260-300\) have to be modified to reflect the number of words available.

The number of words inserted into the puzzle can be increased by setting the value of \(A 1\) higher in lines 490, 590, 690, etc. and resetting the loop at line 1780. This modification increases the time required to place all the words into the puzzle.

\section*{Do speed and animation turn you on?}

\section*{Super Graphics}

Alan R. Moyer 993 San Angelo Drive Hamilton OH 45013

The TRS-80 utilizes various graphics devices; first, SET and RESET (Example 1) and POKE graphics (Example 2). The PRINT method (Example 3) operates faster, allowing simulated animation and other tricks, but you can sit for awhile while all the variables in some programs are initialized into their respective graphics symbols. This PRINT method is commonly
```

10 REM SET 1 LINE OF GRAPHICS
20 CLS:FOR X=0 TO 127:SET(1,X):NEXT X
Example 1: The SET and RESET graphics function

```

\footnotetext{
10 REM POKE 1 LINE OF GRAPHICS
20 CLS:FOR \(X=15360\) TO 15424:POKE X, 191:NEXT X
}

Example 2: The POKE graphics function
called the super graphics method.
With the aid of a monitor utility program that allows you to access specific memory locations, it is possible to insert graphics characters into a program line. If you have a disk system, you can call up DEBUG and directly insert graphics characters.

If you don't have a disk system and want to take advantage of super graphics, you can use the program listing, below, to access and change, in decimal or hexadecimal, a BASIC print line to directly print graphics characters under program control without a 'CHR\$(n)' initialization. One consideration is that the finished program may not be listable, and you cannot edit any line containing super graphics characters.

Incorporating super graphics into your program with this monitor can be done in two ways. The easiest method is to load the monitor program before you do any programming and then type in the lines as you normally would. The monitor program uses high ( 65000 and above) line numbers, so it should not interfere with your program input.

If you already have a program and want to add super graphics, you can include the monitor in your program fairly easily by:
1) CLOADing your program (make sure that no line num-
ber is higher than 64999); 2) Typing in this program:

0 CLS:PRINT"TYPE IN AFTER MERGING POKE 16549"PEEK (16549)":POKE 16548"PEEK(16548): \(E=17129\)
\(1 \mathrm{~S}=\mathrm{E}: \mathrm{E}=\operatorname{PEEK}(\mathrm{S}+1) \cdot 256+\) PEEK(S):IF E>0 GOTO 1 2 POKE16549,INT(S/256):POKE \(16548, \mathrm{~S}-\operatorname{INT}(\mathrm{S} / 256) \cdot 256\) :END
3) Running the merge program;
4) CLOADing the monitor;
5) Executing in immediate mode the commands listed at the top of the screen.
You should now be able to list the combined programs. You can use the monitor to alter the PRINT statements to include super graphics characters.

\section*{The Monitor Program}

The monitor program works by typing RUN 65000. Monitor commands include:
D. Set the number base to decimal (for input);
\(H\). Set the number base to hexadecimal (for input);
Exxxxx-examine memory address xxxxx;
M xxx - Modify current mem. ory address to xxx ;
;-Steps to the next address
(+). Holding the key down continues to step the address until the key is released;
. . Steps to the previous address. Holding the key down continues to step the address until the key is released;
S. Stop program, return to BASIC.
The monitor prints the address and data on the screen in decimal and hexadecimal and the ASCII value (if any) of the address data. You can then modify any address and insert your desired values. The following demonstrates use of the monitor and gives an example of super graphics. This example can be expanded to include elabo. rate super graphics.
1) CLOAD the super graphics monitor;
2) Type in the following line: '10 PRINT "SAMPLE LINE FOR INSERTING GRAPH. ICS";
3) Type in RUN 65000;
4) As the monitor takes over, type \(H\) to establish hexadecimal number base mode;
5) Type E (for examine), then

\footnotetext{
10 REM PRINT 1 LINE OF GRAPHICS
20 CLS:PRINT STRINGS(64,191)
or
10 REM PRINT 1 LINE OF GRAPHICS
\(20 \mathrm{AS}=\mathrm{CHRS}(129)+\) CHRS(131)
+ STRING \((3,158)+\) CHR\$(26)
+ STRING \((5,24)+\) CHR \(\$(185)\)
+ STRING \(\$(4,171)\)
30 REM " 26 " \(=\) LINEFEED,\(~ " 24 "=\)
BACKSPACE
40 CLS:PRINT AS

> Example 3: The PRINT graphics function
}
type in 42E9 (for cassette systems, or 68BA for disk);
6) The monitor displays the address 42E9 and its data. An ASCII value (if any) for the data will be shown in the right hand column;
7) Hold the ; key down to step the address display along. Watch the ASCII column until you see the line you entered show up ("SAMPLE LINE FOR INSERTING GRAPHICS");
8) Use the ; and - keys to get to the beginning of the line;
9) Type in \(M\) (modify) and any value for a graphics character (Table 1);
10) The monitor again displays the address with the new data value. Do this as many times as there are characters within the quotation marks of the PRINT statement (when typing in the original program, include enough spaces in your PRINT statement to include all the graphics and cursor control you need);

HEX FORM OF GRAPHICS

14-LINEFEED
18-BACKSPACE

IRV, one of the most powerful utility programs available, turns your keyboard into a SUPERKEYBOARD.

Now you can have single key programming. IRV comes complete with its own keyboard definitions, or up to 255 characters can be assigned to every key, including (ENTER) and (BREAK). You can enter often used BASIC words, variable names or even entire lines. Even functions, such as RUN, LIST, or EDIT can be entered with a single keystroke.

The relocate feature of IRV is unique, in that it allows single line relocation and renumbering. You can merge lines using the EDIT function and a single keystroke.

As a video editor, IRV is so powerful, you'll wonder how you got along without it. Full cursor control, blinking cursor, block movement and special erase functions are just the beginning. Frequently used video graphics blocks can be saved and used again and again.

Even IR V's minor virtues are impressive. You can have auto repeat with any key, including programmed functions. You won't have to pull plugs or fiddle with a control box to rewind or fast-forward a tape. The cassette recorder can be controlled from the keyboard.

If you are a creative programmer (or wish to be), you need the power and convenience of IRV! (DOS compatible).

\section*{\$24.95 Tape \$2995 Disk C.O.D. Accepted The \(\quad\)-364 \\ PO Box 66} Programmer's Guild

Peterboro, NH 03458 PH (603) 924-6065

11) Type in \(S\) to return to BA. SIC;
12) List the program to inspect your PRINT statement. You should see words like CLS, SET, VAL, etc. They are BASIC commands that the computer normally stores as one byte tokens. These values are normally not available from the keyboard and must be inserted by some other method.

To run the present example, type 20 STOP, so that you can see the display without the monitor program messing up the screen, and run the program. You should now see a number of graphics characters appear on the screen.

You can CSAVE the program with the monitor attached for further development and delete the monitor when finished with a program.

\section*{TRS-80 Owners:} Turn Your Typewriter Into A Printer
... With the KGS~80 Keyboard Actuator
- Plug-in compatibility with the TRS-80 . . . attractive enclosure contains actuator and interface.
- Least expensive way to get letter quality printing.
- No mechanical modifications to the typewriter are necessary.
- Rests firmly above the typewriter keyboard. Can be installed or removed in 5 seconds.
- Does not require any soffware to operate works with Pencil, Scripsit and other word processing programs.
- Solenoids with soft plastic tips strike typewriter keys with the same force a typist would exert.

\section*{[ PUREZZAP}
is a machine language, highly advanced disk sector modifier. Incorporating 4 additional utilities most desired by users. 35 or 40 track. 1 or 2 drives.
*Zero out all unallocated sectors.
-Zero out all killed directory entries.
-Hash code displayed upon entering any filespec.
-Instantly kill format, copy, basic and all system files except boot and dir.
-PUREZZAP reads, modifies and writes any sector.
-Lightning fast cursor movements in 4 directions whether modify mode or not.
- Instant toggle between drives.
-Continues sector compare of any two locations.
-Continues search for the occurrence of any byte.
- Automatic single or multiple duplication of a modified byte.
*Forward or backward 1 to 9 sectors at a time >>instantly<<.
*Fantastic, easy to read, visual display with the relative byte position displayed and updated continuously during any function.
- A super menu and more with easy to understand documentation.
Shipped within 24 hours on a diskette
for only \(\$ 12.95\). Add \(\$ 1.00\) for hanling in USA- \(\$ 3.00\) outside.

\title{
Instant Software:New Releases
} FOR THE TRS-80*

\section*{LIFE}

Would you like to play god?
Even if you've only been involved with computers for a short while, you're certain to have heard of Life. The game was originally created by British mathematician John Conway and popularized in Martin Gardner's Mathematical Games column in Scientific American magazine. Life, a computerized simulation of the life cycle of a colony of bacteria, allows you to manipulate both the bacteria and their environment.
Over the years the game has lost none of its fascination for computerists. It is based on a few simple concepts but it results in captivating, animated graphics displays.
There are two versions of Life included in
this package. The first is written in machinelanguage and is the most versatile, flexible and the swiftest version of Life we've ever seen. The second is in BASIC with machine-language subroutines. This allows both the machine-language devotee and the BASIC aficionado to experiment with the program.

Patterns can be created and edited easily. You can create your own "creatures" or use the library of preprogrammed creatures. You can run at full speed ( 100 to 200 generations per minute), enter a pause factor, or single step through the life cycle.

No matter how you approach Life, whether artisitically, mathematically, intuitively, or just for fun, this is THE classic program.
Order No. 0078R \$9.95

\section*{Winner's Delight}

Are you a winner? Do you enjoy challenging yourself with thorny tasks? Then try Winner's Delight. This quartet includes:
Amazing-You must escape from a maze, one that you view from the inside. You must work against the clock-and you may meet a nasty dwarf who can block your passage to freedom. Junior Checkers-Not your usual game of checkers... The challenge is to beat the computer in the fewest number of moves.
Jumbo Jigsaw-Fit the pieces of the jigsaw together in the fewest number of tries. The program offers three levels of expertise for you to choose from.
Thirteen Ways-Try to fill up your columns with the numbers you roll on dice. Lady Luck may be with you or against you. But you may

be certain that the computer will be plotting how to fill its columns first!

You too can be a winner, with Instant Software!
Order No. 0124R \$9.95

Get to know the Inner You. Use this package to learn your caloric needs and to set up a weight-loss diet. It will also introduce you to human anatomy and physiology.

The Adult Caloric Requirements program can determine your Basal Metabolic Rate, after you respond to a computerized "questionnaire". Then the program makes recommendations on how you can reach an ideal weight, through dietary planning.

Our Flexi-Diet program will create a practical diet for you. Choose your caloric intake, from 600 to 2400 calories per day. The program will make up sample menus for any meal you desire. If you don't care for its choices, it will make as many alternative menus as you like!

In the Anatomy Quiz program, a human torso is drawn on your video monitor and you must locate various organs within the body. After you've made your choice, the program gives a mini-lesson, which includes the organ's size, exact location and major bodily functions.
Body Buddy: Let it change you for the better!
Order No. 0109R \$9.95

\section*{Investor's Paradise}

Imagine that you've been given a large sum of money and have the opportunity to see if you can make a killing in the market...
Stock Trek-This is a stock market simulation in which you and up to five other investors buy and sell stocks. See if you can transform \(\$ 5000\) into a fortune in twelve short months. The program has an automatic ticker tape that announces market conditions plus a stock price display board. You can ask for a prospectus that will describe each stock and its dividend potential. Finally, you can see the performance of each stock displayed on a graph. At the end of one (simulated) year, the computer will display the net worth of all investors. The player with the greatest net worth is advised to start looking at the financial pages.
Speculation-This program goes a step beyond being a mere simulation. You enter the financial data on up to 25 real companies and start playing the market. You can buy and sell shares based on net cost, including sales commissions. You'll be able to compare how you did in the market, based on the value of your portfolio and accumulated dividends, versus investing your money at a fixed rate of interest. This program can simulate up to five years of playing the market in computer time and all your data can be stored on tape for future reference. Although this program isn't intended to simulate actual market conditions, it comes darned close.

The Investor's Paradise package lets you experience all the thrills and triumphs of the stock market without risking a dime.
Order No. 0125R \$9.95

\title{
Displace T-BUG to three different memory locations and you don't need a multiple loader to do it!
}
W. H. Johnson

1838 Willowhurst
Cleveland, OH 44112
f you purchase T-BUG for your TRS-80, you soon learn that all of the machine language programs you would like to be able to look at are loaded into the same area of memory (42E95000 ). If you haven't been able to invest in some of the multiple loading monitors, such as RSM, which load into \(16 \mathrm{~K}, 32 \mathrm{~K}\) and 48 K versions, you are stuck.
This program takes your standard T-BUG monitor, normally loaded from 4380 to 4980, and moves it to three different locations. You can punch a copy of the one that you need or all three.

\section*{Block Moves}

This program block moves T-BUG into locations 7380-7980, B380-B980 and F380-F980 and corrects all of the address references. If you have a relocator program that fixes all references, it won't work on T-BUG or RSM. Some of the code is altered by single instruction operations that are not apparent, unless you fully disassemble the programs and interpret how

\section*{Triple Play for T-BUG}
they work. This can be easy or difficult depending on the way the programmer writes his code.

To start the program, load T-BUG, using the SYSTEM command, and then use the \(M\) command of T-BUG to change the memory locations given in the program. The main program starts at 4C00 and goes to 4 CCB . It uses a set of look-up tables located from 4A00 to \(4 \mathrm{B9F}\). It also uses a set of high byte variables located from 4BAO to 4BA6.

The program does three sets of block moves into each of the areas and then goes into a loop which repeats itself three times. The first time through, the table has the values for the 16 K version (7380-7980). At the end of the first loop, it goes to two subroutines to change, re-spectively, the high byte of the table address and the variable high byte. At the end of the third loop, the program returns to your normal T-BUG.

Use the J command to jump to address 4 C 00 . When you have done this, you can punch whichever version you want on tape using the P command, as in the following:

\footnotetext{
P \(7380798073 A 0\) TBUG73
P B380 B980 B3A0 TBUGB3
P F380 B980 F3A9 TBUGF3
}

Some of the main entry points of T-BUG that save you from writing your own routines are:

4380 Entrance from software breakpoint
43AO Start entrance 117312 decimal 440D Examine memory/modify routine 4455 Display register contents stored in4825-483C
44D3 Punch a system tape
4506 Load a system tape
450F Display character pointed to byIX + Oas 2 hex

4532 Display ASCII character on screen
4589 Get 2 hex characters in \(A\)
45A4 Get a hex character in \(A\) 45C8 Input a character from keyboard 47DF Set breakpoint routine 480D Clear breakpoint routine

T-BUG installs a C3 8043 (jump to address 4380) that initializes a new stack, stores all of the registers in 4825-483C, displays the \# on the screen,

clears the 18 columns and waits for a new command.

You also have to execute the breakpoint before the F command will restore the three bytes to the original program locations. I mention this only in case you decide to write a program with a number of relative jumps and happen to choose the breakpoint within one of the looping structures. Relative jumps use two bytes of code and, of course, can go forwards and backwards.

There is one trick you can use with T-BUG, if you have a 16 K machine and are willing to use very short programs in Level II BASIC. You can put the normal T-BUG into memory with the SYSTEM command and then modify the pointers for the BASIC interpreter, so that the computer starts its storage area above the top of T-BUG. Change
the following hex locations to 4980 (don't forget to put the LSB first, i.e., 80 49):

\section*{40F9 80 \\ 40FA 49 40FB 80 40FC 49 40FD 80 40FE 49}

This way, your BASIC starts storing programs at 4980 hex and does not know that T-BUG is in memory. One caution: If you must hit the reset button, the pointers are restored to the normal values of 42E9 in the three locations. If this happens, you get all sorts of gibberish in most cases.

To recover from a crashed program like this, call SYSTEM and, instead of typing the name, use \(/ 17312\) and press ENTER. You should be back in T-BUG and can reset the addresses using the M command.

\title{
Take Me Beyond Your Leader
}

\author{
Robert McTernan \\ 42 Aspinwall Road \\ Red Hook, NY 12571
}

After trying various brands of short leaderless cassette tapes on my TRS-80 with various degrees of success, I thought I would try some of my Maxell UD cassettes, since I have had nothing but perfect results using that tape for audio applications.

Voila! Again, perfect results. My tape problems disappeared.

Only one problem. Many times, I found myself forgetting
to advance the tape manually to the oxide before CSAVEing my programs. Since bits adhere to tape leaders like water to a duck's back, computer time went down the drain. However, I like the idea of using a tape with nonabrasive head cleaning leaders.

You may also have experienced my occasional problem of forgetting, in haste, the little ? after a CLOAD used to verify a program tape. Or how about an unnoticed keybounce when keying your program label? Ever experience any or all of the above?

\section*{Two-liner Preventive}

Listing 1 is a multi-statement two-liner that prevents all of the above and produces two verified copies of your program.
Place the routine at the end of your program. When you are ready to CSAVE it, type GOTO1000 and off you go. Follow the prompts and you can't go wrong.
Of course, the routine has to be modified to accommodate your CSAVE labels or you may have to use a higher line number. Just be sure that the GOTO address in the PRINT statement,
```

1000 CLS: INPUT*READY TAPE \& ENTER*;X:ZS=STRINGS(10.*日*):PRINT*-1,Z5:PRINT*SAUING COPY $1^{*}:$ CSAUE* $A^{*}:$ PRINT ${ }^{*}$ SAUING COPY $2^{*}: C S A U E * B^{*}:$ INPUT*REWIND, PLAY' \& ENTER** $X$ : PRINT*UERIFYING COPY 1. AT •READY', GOTO1010*:CLOADPRINT 1010 PRINT*VERIFYING COPY $2^{*}: C L O A D P R I N T$

```

Listing 1.
" . . . . AT 'READY', GOTO1010", is appropriate for the line numbers you use to contain the routine.

The routine advances the leader to about two inches short of reaching the tape oxide. At this point, the CSAVE operation starts and two copies of your program are written. A prompt then advises you to rewind the tape, place the recorder in play and ENTER. The first copy is then verified. Since a CLOAD always returns to BASIC (READY), type GOTO1010 to verify the second copy of your program.

When your program is completed, delete this routine from memory before your final CSAVE.

The concept of the above routine can also be applied to data tapes to snip off your tape leaders.

\section*{Subscription Problem?}

80 Microcomputing does not keep subscription records on the premises, therefore calling us only adds time and doesn't solve the problem.

Please send a description of the problem and your most recent address label to:

\section*{Asteroid Adventure}

\author{
Greg Perry \\ 6104 E. 48th St. \\ Tulsa, OK 74135 \\ Don Taylor \\ 2855 S. 96th E. PI. \\ Tulsa, OK 74129
}

Despite widely held beliefs, it is possible to write enjoyable programs for the TRS-80 Level II with only 4 K of memory. Take Asteroid Adventure for example.
The object of this space game is to guide your ship through the asteroids of space, land on the moon safely and have fuel to spare.

At the beginning of the program, you
will be asked to enter your experience level from one to ten. One is for advanced players, and ten is for beginners. The first time you play you might enter a five.
The screen clears and a field of asteroids (*'s) is printed. On the right-hand side of the screen a half-moon appears and in the lower right corner a fuel reading, based on your experience level, is printed.

Your space ship is the greater-than sign in the upper left corner. Use the four arrow keys to guide your ship. Holding a key down causes continuous movement.

The game commences when the first direction key is pressed. At this time, your fuel consumption begins.

Hopefully, you can maneuver your ship to the moon and land safely. On the way, if you hit an asteroid, you will blow-up. Also, keep an eye on your fuel reading; you wouldn't want to be caught in space with no gas!

\section*{About the Program}

The asteroid field is printed using the
random-number generator so the field is different every play. Your ship is moved by using PEEK statements starting at line 190.

Hitting an asteroid or landing on the moon is detected by a PEEK that scans the next screen location in the direction of the current movement.

The speed of the game, as well as the amount of fuel you have are determined by the number that was entered as your experience level.

$\$ 149.95$

## soon/available

 soon/availablesoon/available

1-5. The UNIVERSAL DATABASE MANAGER (UDBM) and its four add on modules are compatible with any file created with RADEX-10
6. The SORT REPORT MODULE gives you the ability to create reports which sort the records of any RADEX-10 or UDBM file by any KEY and any SUB KEY and print them on the report.
7. The SORT DATABASE MODULE gives you the ability to sort the records of any RADEX-10 or UDBM file and write those records onto a new file or append those records to an existing file with the same file structure as the source file. (Both the SORT REPORT and SORT DATABASE modules use the 48K INFINITE BASIC machine language sort of RACET COMPUTES.)
8. The RESTRUCTURE DATABASE MODULE gives you the ability to read the records of any RADEX-10 or UDBM file and then write those records onto another file with a different file structure, thus allowing you to ADD, DELETE, or CHANGE FIELDS of a database file without having to re-key-in the data

## Let Your TRS-80 Teach You ASSEMBLY LANGUAGE

Tired of buying book after book on assembly language programming and still not knowing your POP from your PUSH?

REMSOFT proudly announces a more efficient way, using your own TRS-80 ${ }^{\circ}$, to learn the fundamentals of assembly language programming --at YOUR pace and at YOUR convenience
Our unique package, "'INTRODUCTION TO TRS-80" ASSEMBLY PROGRAMMING", will provide you with the following:

- Ten 45-minute lessons on audio cassettes
- A driver program to make your TRS-80 ${ }^{\circ}$ video monitor serve as a blackboard for the instructor
- A display program for each lesson to provide illustration and reinforcement for what you are hearing
- A textbook on TRS-80 Assembly Language Programming
- Step-by-step dissection of complete and useful routines to test memory and to gain direct contro over the keyboard, video monitor, and printer
- How to access and use powerful routines in your Level II ROM
This course was developed and recorded by Joseph E. Willis and is based on the successtu series of courses he has taught at Meta Technologies Corporation, the Radio Shack Computer Center, and other locations in Northern Ohio. The minimum system required is a Level II, 16K RAM
REMASSEM-1 only $\mathbf{\$ 6 9 . 9 5}$

## 80 microcomputinğ

# 3 new lonoks irom flie editors of KiB \& $\mathbf{S N}^{(1)}$ Microcomputing 

- 40 COMPUTER GAMES - BK7381 - Forty games in all in nine different categories. Games for large and small systems, and even a section on calculator games. Many versions of BASIC used and a wide variety of systems represented. A must for the serious computer gamesman. $\$ 7.95^{\circ}$
- SOME OF THE BEST FROM KILOBAUD/MICROCOMPUTING-BK7311-A collection of the best articles that have recently appeared in Kilobaud/MICROCOMPUTING. Included is material on the TRS-80 and PET systems, CP/M, the 8080/8085/Z80 chips, the ASR-33 terminal. Data base management, word processing, text editors and file structures are covered too. Programming techniques and hardcore hardware construction projects for modems, high speed cassette interfaces and TVTs are also included in this large format, 200 plus page edition. $\$ 10.95$.*
-UNDERSTANDING AND PROGRAMMING MICROCOMPUTERS - BK7382 - A valuable addition to your computing library. This two part text includes the best articles that have appeared in 73 and Kilobaud Microcomputing magazines on the hardware and software aspects of the new microcomputing hobby. Well known authors and well structured text helps the reader get involved in America's fastest growing hobby. $\$ 10.95^{*}$

## Other Books

- INSIDE LEVEL II-BK1183-For machine language programmers! This is a comprehensive reference guide to the Level II ROMs, allowing easy utilization of the sophisticated routines they contain. It concisely explains set-ups, calling sequences, variable passage and I/O routines. Part II presents an entirely new composite program structure which unloads under the SYSTEM command and executes in both BASIC and machine code with the speed and efficiency of a compiler. Special consideration is given to disk systems. \$15.95.*
- TRS-80 DISK AND OTHER MYSTERIES - BK1181 - by Harvard C. Penning. ton. This is the definitive work on the TRS-80 disk system. It is full of detailed "How to" information with examples, samples and in-depth explanations suitable for beginners and professionals alike. The recovery of one lost file is worth the price alone. $\$ 22.50$.
> - PROGRAMMING THE Z-80-BK1122 - by Rodnay Zaks. Here is assembly language programming for the Z-80 presented as a progressive, step-by-step course. This book is both an educational text and a self-contained reference book, useful to both the beginning and the experienced programmer who wish to learn about the Z-80. Exercises to test the reader are included. $\$ 14.95 .{ }^{*}$

- LEARNING LEVEL II-BK1175-by David Lien. Written especially for the TRS-80, this book concentrates on Level II BASIC, exploring every important BASIC language capability. Updates are included for those who have studied the Level I User's Manual. Sections include: how to use the Editor, dual cassette operation, printers and peripheral devices, and the conversion of Level I programs to Level II. \$15.95.
- THE BASIC HANDBOOK-BK1174 -by David Lien. This book is unique. It is a virtual ENCYCLOPEDIA of BASIC. While not favoring one computer over another, it explains over 250 BASIC words, how to use them and alternate strategies. If a computer does not possess the capabilities of a needed or specified word, there are often ways to accomplish the same function by using another word or combination of words. That's where the HANDBOOK comes in. It helps you get the most from your computer, be it a "bottom-of-the-line" micro or an oversized monster. \$14.95.
* Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to 80 Microcomputing Bookshelf e Peterborough NH 03458. Be sure to include check or detailed credit card information. No C.O.D. orders accepted. All above add $\mathbf{\$ 1 . 0 0}$ handling. Please allow $4-6$ weeks for delivery. Questions regarding your order? Please write Customer Service at the above address.

## MONEY-MAKING

- HOW TO MAKE MONEY WITH COMPUTERS - BK1003 - In 10 information-packed chapters, Jerry Felsen describes more than 30 computer-related, money-making, high profit, low capital investment opportunities. \$15.00.
- HOW TO SELL ANYTHING TO ANYBODY - BK7306-ACcording to The Guinness Book of World Records, the author, Joe Girard, is "the world's greatest salesman." This book reveals how he made a fortune - and how you can, too. \$2.25.*
- FREELANCE SOFTWARE PUBLISHING - BK1179 - by B. J. Korites. "This book is about money and how to make it by writing and selling computer programs," (author's foreword). If you have the skills to write a saleable program, you now need to acquire the skills to sell that program. This compact book comprehensively covers the entire publishing process and many aspects of software salesmanship. \$14.95.*
- THE INCREDIBLE SECRET MONEY MACHINE - BK1178 - by Don Lancaster. A different kind of "cookbook" from Don Lancaster. Want to slash taxes? Get free vacations? Win at investments? Make money from something that you like to do? You'll find this book essential to give you the key insider details of what is really involved in starting up your own money machine. $\$ 5.95$.*

## business

- PAYROLL WITH COST ACCOUNTING - IN BASIC - BK1001 - by L. Poole \& M. Borchers, includes program listings with remarks, descriptions, discussions of the principle behind each program, file layouts, and a complete user's manual with step-by-step instructions, flowcharts, and simple reports and CRT displays. Payroll and cost accounting features include separate payrolls for up to 10 companies, time-tested interactive data entry, easy correction of data entry errors, job costing (labor of distribution), check printing with full deduction and pay detail, and 16 different printed reports, including W-2 and 941 (in CBASIC). $\$ 20.00$.
- SOME COMMON BASIC PROGRAMS—BK1053-published by Adam Osborne \& Associates, Inc. Perfect for non-technical computerists requiring ready-to-use programs. Business programs, plus miscelianeous programs. Invaluable for the user who is not an experienced programmer. All will operate in the stand-alone mode. \$12.50 paperback.
- PIMS: PERSONAL INFORMATION MANAGEMENT SYSTEM - BK1009 - Learn how to unleash the power of a personal computer for your own benefit in this ready-to-use data-base management program. $\$ 11.95$.

[^7]

ANADEX
DP9500/DP9501 PRINTERS

New from Anadex! Two low cost, high performance printers
designed for all applications, including standard high-density designed for all applications, including standard high-density graphics capability. Both models feature a 9 wire print head with an incredible lite expectancy of 650 million printed characters Full 96 character ASCII set with lower case descenders, double width printing. bi-directional with shortest distance sensing logic. Adjustable-width tractor feed, forms control, horizontal and vertical tabbing. and print up to five copies. Easy interfacing with parallel. RS-232 serial of current loop choices
The DP9500 is the choice when you require mostly printing and occasional graphics. Select between a $9 \times 9$ character fort and 132 columns, or a $7 \times 9$ font for 175 columns. Printes speed. 150/200 CPS WI 35 lbs
The DP9501 is mainly for graphics applications The $11 \times 9$ character font produces superb graphics reproduction in 132 columns. and the $7 \times 9$ character font in 220 columns provides maximum graphics potential Both models operate at 110 VAC and 220 VAC tor European use. Wt 35 ibs
Cat No. 2551 DP9500 printer
Cat No. 2552 DP9501 printer

Note: Not for use with ATARI Programmable Computers

##  RAM BOARD

8 K bytes by 8 bits, fully buffered. compatible with 8080 8085, and 280 . Dip switch addressing of independant 4 K halves lets the M868 think like two 4 K boards. or one 8 K board. independent 4 K addressing allows the fiexibility to meet varying software memory needs Uses low power 21102 RAM's. operates at 2 or 4 MHZ , and is compatiole with direct memiory
access controllers

INCORPORATED

## ^NEW $\star$ MTC AIDS-III* $\star$ NEW $\star$

## MODEL I... $\mathbf{\$ 6 9 . 9 5}$ MODEL II... $\mathbf{\$ 9 9 . 9 5}$

Introducing the latest addition to MTC's family of data management systems. AIDS-III. NO PROGRAMMING, easy to use COMPLETE PACKAGE including demonstration application documentation and MAPS III (see below).

- Up to 20 USER-DEFINED FIELDS of either numeric or character-type
- CHARACTER type fields may be any length (total: up to 254 characters)
- NUMERIC type fields feature automatic formatting, rounding, decimal alignment and validation.
- Full feature EDITING when adding or changing records

ENTER FIELD (can't type in more characters than specified)
BACKSPACE (delete last character typed) RIGHT- JUSTIFY FIELD contents
DELETE FIELD contents
SKIP FIELD (to next or previous field) RESTORE FIELD contents SKIP RECORD (to next or previous record)

- SORTING of records is MACHINE CODE assisted

200 RECORDS ( 40 characters) in about 5 SECONDS
ANY COMBINATION of fields (including numerics) with each field in ascending or descending order

- SELECTION of records for Loading. Updating. Deleting. Printing and Saving is MACHINE CODE assisted

Specify up to 4 CRITERIA, each using one of 6 RELATIONAL COMPARISONS.
LOAD or SAVE selected records using MULTIPLE FILES.
Example: Select records representing those people who live in the state of Colorado, but not in the city of Denver, whose last names begin with " $F$ ' and whose incomes exceed $\$ 9000.00$.
Example: Select records representing those sales made to XYZ COMPANY that exceed $\$ 25.00$, between the dates $03 / 15$ and $04 / 10$.

MAPS-III (MTC AIDS PRINT SUBSYSTEM), included at no charge.

- COMPATIBLE with AIDS-II data files arid AIDS subsystems
- Move up from AIDS-II and EXPAND to 20 field capability WITHOUT REENTERING DATA
- AIDS II (Model I or II) owners may UPGRADE FOR ONLY $\$ 25.00$

WARNING' This program is written in BASIC and can be listed in the normal manner Modification of program code is NOT RECOMMENDED due to its extreme complexity

## NEW

## the MAGIC WANDт <br> SPECIAL!............ . $\$ 299.95$

NEW
the most powerful, most flexible, most reliable, most useable word processing software available for a CP/M ${ }^{*}$ based TRS $-80^{\circ}$ model II.
MAGIC WANDTM can do more work in less time with high quality than any other product you can buy.
The command structure is simple, logical and complete. The programs are crash-proof and completely reliable.
The system is supported by what users say is the best user's manual ever produced for microcomputer software.

- Full screen text editing
- Full text formatting commands
- Merging with external data files

OUOTES FROM THE June, 1980 Microcomputing article "Super Word Processors" by Rod Hallen
"Of all the word processors I have used (and that includes a dozen or more), the Magic Wand is the most versatile. The Wand has almost all of the features of other processors, plus many new ones of its own. It measures up to even the word-processing software running on the largest mainframe computers."
."Magic Wand is an outstanding example of the new levels of software that are being written for the small businessman, although I can't imagine a business of any size that couldn't use software of this quality."
MAGIC WAND - will also operate on Oasis based systems
will operate on 16k but we recommend $32 k$ for adequate operating memory is available on $51 / 2$ and 8 diskettes

MAGIC WAND is a copyrighted program by Small Business Applications Inc., TRS-80 is a registered trademark of Tandy Corp., CP/M is a registered trademark of Digital Research Corp.

## AIDS

CALCULATION SUBSYSTEM (CALCS)
MTC's most popular AIDS subsystem. Use for report generation involving basic manipulation of numeric data. Prints user-specified fields in titied, columnar report format, automatically generating column headings, paging and (optionally) indentation. Features full AIDS-III selection capabilities and can create a single report from multiple files. Provides the additional capabilities of user-specified balance forward computations, columnar subtotals, columnar totals and user-defined computations (allows multiplication, division, addition, and subtraction of field values and constants). Features may be used in combination. For example, the calculation of a user-defined quantity/cost column may simultaneously be listed by itself, used as part of a balance forward computation and as part of either (or both) a columnar subtotal or columnar total. Use for accounting, inventory. financial and other numeric-based information systems.
MTC CALCS
\$ 24.95
For Model II
\$ 39.95

## Apparat, Inc. introduces

## NEWDOS/80

Apparat's long-awaited successor to NEWDOS + is here! This is not an enhanced version of NEWDOS, but a completely new product. Simplified DOS commands can be instantly executed from BASIC, even within a program, without disturbing the resident code. System options, such as password protection, number and type of disk drives. BREAK key enable/disable and lowercase modification recognition, can be quickly and easily changed. Five new randomaccess file types allow record lengths of up to 4096 bytes, and no FIELDin!! A powerful CHAIN facility allows keyboard INPUTs to be read from a disk file. An improved RENUMBER facility permits groups of statements to be relocated within program code. Diskettes may even be desinnated as RUN.ONLY! Features all deswboted utilies (SUPERZAP 3.0, etc.) and NEWDOS+ Utilities (SUPERZAP 3.0, etc.) and
much more! One MTC technical staft member said having NEWOOS/80 is "better than sex" (you'll have to judge for yourself!). Includes 180-page instruction manual and MTC QUE card.
NEWDOS/80.

Transfer PROGRAMS and DATA from MODEL I to MODEL II

## TRAN-SEND $\$ 49^{95}$ by MTC

Requires MODEL II and MODEL I with disk 8 RS-232. Simple to use, not a kit - nothing else to buy. Complete with custom cable, $5^{1 / 4^{\prime \prime}}$ \& 8" floppies, instructions. May be used over phone lines. Custom Cable only
$\$ 19.95$
Suitable for use with Radio Shack* transter program(ACI 0131)
$\star$ PRODUCT PREVIEW $\star$
General Business System for Model II
This product will be a full-feature, professional. grade business system, with fully integrated General Ledger, Accounts Receivable and Accounts Payable. A Payroll subsystem will be added later.
PROGRAMMING TOOLS
TDAM ..... 95
For Model il
Includes MTC QUE Card!

Having trouble with RANDOM FILES? With MTC's
Table-Briven Access Method (TDAM) you'll never Trable-Driven Access Method (TDAM) you'l never
fret over FIELDing again. No knowied se of irandom access files is required. Insert the fDAM "interpreter" into any BASIC program and type in a few DATA statements describing the information in your files. TDAM does the rest! Reads and writes fields and records of any type (even compresses a DATE field into 3 bytes!). Features presses a Dile bufter allocation/deallocation. automotic buffering. sub-record blocking/deblocking, and handies up to 255 fields per record. Super fast and super simple! Complete with TDAM interoreter, instructions and demo program. Requires programming experience.

## DIVERGE

$\$ 19.95$
For Model il
$\$ 29.95$
Compares two BASIC program files, showing the differences between them. Identifies 8 lists lines which have been inserted, deleted. \& replaced. Use for version control.

## REBUILD <br> $\$ 19.95$ <br> For Model il $\$ 29.95$

Reorganize programs for adding program code. faster execution, readability. Much more than simple renumbering. Rearrange groups of statements within a program - automatically updates references to line numbers. Use with SUPERSEDE and MINGLE for maximum effect.

Let Your TRS-80 ${ }^{\circ}$ Teach You

## ASSEMBLY LANGUAGE

 DISK I/O TECHNIQUESREMSOFT does it again! REMDISK- 1 is a concise, capsulated supplement to REMASSEM-1. Package consists of two 45 -minute lessons on audio cassettes, and display programs providing illustration and reinforcement. Provides specific track and sector $1 / 0$ techniques, and sequential and random file access methods and routines.

## ADVERTISERS

[^8]
# When It Comes To TRS-80 Add-on Memory... 

# LOBO Has It All. 

LOBO DRIVES manufactures disk drive subsystems designed to provide TRS-80* users with a wide selection of low-cost, high-speed efficient, mass-storge capabilities. Every LOBO DRIVES Memory System is thoroughly tested and burned-in to assure reliability and carries LOBO's unique one year. $100 \%$ parts/labor warranty

Expansion and enhanced capabilities are key words in achieving full utilization of your computer system. LOBO DRIVES complete line of TRS-80 compatible disk drive subsystems is the ideal, cost effective way to provide the expansion capabilities you need to meet your system growth requirements.
-TRS-80 is a trademark of Radio Shack. A Tandy Company

## TRS-80 MODEL II

LOBO DRIVES makes expanding your TRS-80 Model II very, very easy. Now you can add more floppy disk memory at less cost. And, LOBO can provide you with up to 40 MBytes of fixed disk Winchester technology storage capacity that is completely software compatible to your Model II.

- Model 800-850 8-inch dual Floppy Systems
- Model 1850 Dual Floppy/Fixed Disk Memory System

## MODEL 1850 DUAL FIXED/FLOPPY DISK MEMORY SYSTEM

LOBO DRIVES has combined a 5 or 10 MByte Winchester technology fixed disk and 1.6 MByte double-sided, double-density floppy disk drive in one cabinet. The unique controller can accommodate two dual units. Now you can have the speed and reliability of fixed disk, with built-in floppy back-up.

- 5 or 10 MByte Fixed Disk Capacity
- Up to 1.6 MByte Floppy Disk Capacity
- Winchester Reliability
- Software Compatible

MODEL 800/850 DUAL FLOPPY DISK MEMORY SYSTEM

Complete with stylized cabinet, power supply, controller, interface, and cables, the Model 800/850 Dual Floppy Disk Memory System is the ideal way for the serious user to expand his disk-based TRS-80

- Up to 3.2 MBytes Capacity
- Single-side, Single or Double Density
- Double-Side, Single or Double Density
- Complete Software Compatibility
- High Speed Access Time

## MODEL LX80 EXPANSION INTERFACE

LOBO DRIVE's new Model LX80 expansion interface enhances system performance by expanding disk storage capacities beyond 40 MBytes, adding a second serial port and facilities for an additional 32 K RAM. The LX80 permits you to achieve the maximum expansion capabilities of your TRS-80.

- Connects Directly to Keyboard
- Two Serial Ports (optional)
- One Parallel Expansion Port (standard) - One Parallel "Centronics" Printer Port (Standard)
- Supports Double Density $51 / 4$ and 8 inch Floppies
- Separate Port for 8 -inch Floppies
- Switch for Overriding Keyboard ROM
- Separate Port for Fixed Disk Drives

## MODEL 950 DUAL FLOPPYIFIXED DISK MEMORY SYSTEM

LOBO combines the outstanding capabilities of the latest technological breakthrough in disk drives, the Shugart Technology $51 / 4$-inch Micro Winchester fixed disk drive with the proven reliability of the Model 400/450 Floppy Disk in one

## MODEL $4005^{1 ⁄ / 4}-$ INCH FLOPPY DISK MEMORY SYSTEM

A low-cost, high performance, software compatible Floppy Disk for TRS-80 Model I users.

- Up to 220 KBytes Capacity
- Single/Double Density
- Soft Sector Format
- 298 Msec Access Time

See your nearest dealer, call, or write for the somplete LOBO DRIVES story find out just how competitively priced a quality drive can be
