DYNAMIC COLOR NEWS is published monthly by DYNAMIC ELECTRONICS, INC., P.O. Box 896, Hartselle, AL 35640, phone (205) 773-2758. Bill Chapple, President; Dean Chapple, Sec. \& Treas.; John Pearson, Ph. D. Consultant; Bob Morgan, Ph. D., Consultant.

Entire Contents (c) by DYNAMIC ELECTRONICS INC., 1986. DYNAMIC COLOR NEWS is intended for the private use of our subscribers and purchasers. All rights reserved. Contents of this newsletter may not be copied in whole or in part without written permission from DYNAMIC ELECTRONICS INC. Subscriptions are $\$ 15 / y r$ for U.S.A. \& Canada, $\$ 3 \varnothing$ other foreign.

The purpose of this newsletter is to provide instruction on Basic \& Machine Language programming, Computer theory, operating techniques, computer expansion, plus provide answers to questions from our subscribers.

The submission of questions, operating hints, and solutions to problems to be published in this newsletter are encouraged. All submissions become the property of Dynamic Electronics if the material is used. We reserve the right to edit all material used and not to use material which we determine is unsuited for publication.

We encourage the submission of Basic and Machine Language Programs as well as articles. All Programs must be well documented so the readers can understand how the program works. We will pay for programs and articles based upon their value to the newsletter. Material sent will not be returned unless return postage is included. Basic \& ML programs should be sent on a tape or disk \& comments should be sent as a DAT or BIN file.

## $256 K$ \＆ 512 K

 MEMORY UPGRADESIf you have a 64 K computer with sockets for the SAM and 4164 chips then you can update it to 256 K or 512 K ．The ramdisk allows programs to be retain within your computer and loaded as needed．Features include：
＊4ø Track Single Disk Swap Can serves as second drive．
＊Fast 35／40 Track Ramdisk （2 Ramdisks with 512K）．
＊ 32 K to 200 K printer spooler （40ØK with 512 K RAM）．
＊More then 30 PMODE 4 screens at once．
＊Pager configures computer for 8 （16 with 512K）32K pages．
＊OS－9 Ram Disk 35－40 track single sided or $4 \varnothing$ track double sided with 512 K ．
＊Memory is protected when the computer is reset．
＊Solderless installation．
＊Miniature toggle switch can force computer into 64 K mode．
＊Compatible with all software．
Software is supplied on tape or disk execept OS－9 is not available on tape．Specify your choice when ordering．Assemblies are complete ready to install with memories and 64 K mode switch．Order ME－16 for 256K assembly，ME－14B provides extra 256 K for ME－16．ME－16A for 512 K assembly．

| ME－16 $-\quad 256 K ~ R A M ~$ | $\$ 89.95$ |
| :--- | :--- | ---: |
| $M E-14 B-$ Second $256 K$ | 69.95 |
| for ME－16 | 159.95 |

ME－1סA Upgrades 64K Korean＊ Computers to 128 K ．\＄49．95＊

ME－12－Upgrades all 64 K com－＊ puters with 4164 memory chips to＊ 128K．\＄49．95

## VIDEO REVERSER＊

An integrated circuit that＊ mounts on the 6847 and reverses＊ the video reducing eye strain．＊ Minor soldering for CC－2．\＄9．95＊

MEMORY SAVER＊
（Uninterrupted Power Source）
Our UPS saves your programs from＊ being lost due to power fail－＊ ures by providing power to the＊ memories from its battery．The＊ assembly consists of a control＊ circuit，battery，miniature tog－＊ gle switch and a light emitting＊ diode（LED）．The control cir－＊ cuit and battery mount under the＊ keyboard or can be mounted out－＊ side．The switch enables the＊ UPS and the LED glows when power＊ is available．For all computers＊ with 5 volt memories．\＄59．95＊

## MEMORY MANAGER <br> （New Product）

A complete set of software for＊ managing the second 32 K memory＊ bank for 64 K and larger compu－＊ ters．Run Basic programs in both＊ banks，continue a basic program＊ from one bank to the other，use＊ the second bank for a RAM DISK，＊ configure the computer for the＊ all RAM mode and store programs＊ in the upper memory．\＄27．95＊ cassette，$\$ 29.95$ disk．

24 hr phone．Checks，VISA \＆MC cards．Add $\$ 3$ ship．
DYNAMIC ELECTRONICS INC．＊ P．O．Box 896（205）773－2758＊ HARTSELIE，AL $3564 \varnothing$＊

## WRITING PROGRAMS

（Part 14）
In this series we have been explaining how to write basic programs．For the last few months we have been looking at creating seperate files．This can get very involved but is a good application for the pro－ gramming material we have co－ vered．We want to continue with this，but first let＇s take some new material．

## EDITING BASIC PROGRAMS

The extended basic edit com－ mand is very powerful．We want to show how to use this for editing our basic statements． We will cover a few of these each month．Extended basic is required for using the edit feature．

## INSERT \＆DELETE

These two commands will al－ most handle the edit require－ ments．Let＇s take an example and show how to use them．

10 PRINT＂THIS S A XCDMPUTER．＂
We want to add an I before the $S$ to form the word＂IS＂and elimi－ nate the $X$ preceeding COMPUTER． To get into the edit mode type ＂EDIT 10＜ENTER〉＂．The following will appear．

10 FRINT＂THIS S A XCDMFUTER．＂
The cursor will appear on the first character which is the $P$ in PRINT．Move the cursor with the space bar to the $S$ where we want to insert the I．Then do the following：

1．Type＂I＂to enter the insert mode．
2．Type another＂I＂to insert an I．This will appear on the screen．

3．Hold the shift key down and press the＂UP ARROW＂．This exits the insert mode．

We have inserted the I for IS． You can now press the＂L＂key and the line will be displayed in its present form and the cursor will appear on the first character．The＂I＂should be inserted．You are still in the EDIT mode．

Now move to the $X$ by using the space bar several times． Then press the＂D＂key once． This will delete one character which is the $X$ ．You can move back and forth with the space bar and left arrow to verify that the $X$ has been deleted． Pressing＂L＂lists the line and puts the cursor in the first position．If the statement is like you want it，then press the ＂ENTER＂key to complete the editing process．

Let＇s summarize these commands．

1．To enter the edit mode type EDIT LINE NUMBER ENTER． Example：EDIT 10 ©ENTER〉
2．The cursor is over the first character．Move to the char－ acter to be edited by using the space bar and left arrow．
ミ．Pressing＂D＂will delete the character under the cursor． Press＂D＂for each character you want to delete．
4．Press＂I＂to insert charac－ ters．Type in the characters you want to insert．Hold the shift key down and press the up arrow key to exit the in－ sert mode．
5．Typing＂L＂will list the program and leave you in the edit mode．
b．Press «ENTER〉 to exit the edit mode．

We will cover more on using the EDIT command next month．

## PROGRAMMING

Last month we gave some examples on editing a text file. We showed what would be involved in deleting characters or inserting characters. To delete N characters we have to move all characters past those deleted forward in memory $N$ locations. If we insert $N$ characters then we have to move all characters back in memory by $N$ locations. Let's look at moving blocks of text.

## BLOCK MOVING

Why would we want to move a block of text? Suppose you have an address file of customers. You would like to rearrange the file so that all of the customers in the same state or city are ordered together. Or maybe you would like to update your mailing list and move less active customers to the end of the list. Let's look at the pointers we would need first.

1. $X=$ Erginning of the block
2. $Y=$ Ending of the block
3. Z=New location for the block.

There are two methods we can use. Let's demonstrate these with example programs.

```
5 ?"ELOCK MOVE SUBROUTINE
10 FOR J=1 TO Y-X
15 'PUT CHARACTER IN A
20 A=PEEK(J)
25 'MOVE ALL CHARACTERS UP ONE
        lOCATION
30 FOR K=X+1 TO Z
40 E=PEEK(K):POKE E-1,K
50 NEXT K
55 'STORE THE CHARACTER IN THE
        NEW LOCATION
60 POKE Z,A
70 NEXT J
```

The preceeding program would be very time consuming. It holds the first character in $A$
and then moves all characters to create a space at $Z$. Then the value $A$ is stored in $Z$. It then takes the next character and continues until all characters have been moved.

## MEMORY BUFFER

The time can be greatly reduced by using a memory buffer. A good place to put the buffer would be at the end of the text file. Lets look at a program for using this method of moving a block.

```
10 'MOVE A TEXT ELOCK TO END OF
        FILE-EF
15 P=EF:ES=Y-X
20 FOR J=X TO Y
30 A=PEEK(J)
40 POKE P,A:P=P+1
50 NEXT J
60 'MOVE TEXT FORWARD TO FILL
    IN WHERE THE ELOCK WAS
70 FOR J=Y TO Z
80 A=PEEK(J)
90 POKE J-ES,A
100 NEXT J
110 'MOVE THE ELOCK TO THE NEW
        LOCATION
120 FOR J=0 TO ES-1
130 A=PEEK (J+EF)
140 POKE Y-ES+J,A
150 NEXT J
```

## ML SUBROUTINES

Eecause of the slowness of basic for quickly moving blocks of information, we will use machine language (ML) subroutines for moving information in our files. We are starting a series on ML Programming in this issue and suggest that you read these so you can understand how a ML Subroutine works. A ML subroutine can be linked to basic with the EXEC command. A number follows the EXEC command. This number is the memory location where the ML subroutine starts. When the ML subroutine is completed, it returns to basic. So as far as basic is concerned, it thinks that the ML
subroutine was a basic subroutine.

The example basic subroutines we are giving show how to move information. The procedure is the same when using ML Subroutines. Techniques for programming are similar even when different programming languages are used.

We have been using an address or text file as an example. We also want to show how to create a file similar to a spread sheet so that mathematical operations can be performed. Other file example would be a monthly record of expenses,inventory file, and depreciation schedule for capital equipment.

The Basic commands that we will be using have been covered in this series. So now we are giving examples of how to use the programming skills we have devel oped.

## MI PROGRAMMING (Part 1)

Due to the requests of our readers we are starting this series. As an introduction let's define our objectives. First of all we want to look at the microprocessor's architecture. We will show in general terms how the microprocessor and its support circuitry works. The second thing we want to show is how to hand assemble machine language codes. This is good practice because it will really give you an insight into the operation of the microprocessor. We can expand this and design a simple assembler that you can use.

Dur third objective will be to show how to merge machine language subroutines with basic programs. This is the technique we use for most of our programming. This is a very powerful tool because you have the
ease of programming in basic and the speed of machine language subrautines.

Also we will define the operations that can be performed. If you have an assembler then this will make it easier for you to understand how to use it. Where possible we will relate ideas to basic.

## $68 \emptyset 9$ STRDCTURE

A microprocessor has internal registers that hold values. $A$ register can operate on another register or external memory. As an example the $A$ and $B$ registers are generally used for calculations. These are 8 bit registers and can hold a value up to 256. We will be using binary and hexidecimal arithmetic. Hexidecimal consists of 4 binary bits and has a decimal value from $\varnothing$ to 15. It uses the numbers from $\rrbracket$ to 9 and the letters from $A$ to $F$ to indicate values from 10 to 15 respectively. Other 8 bit registers are the direct page register and the conditional code register. Each of these registers contains useful information which we will explain later. There are four 16 bit registers. These are generally used as pointers and are labeled $F C, X, Y, U$, and $S$. $F C$ stands for Program Counter. This points to the memory that contains the next instruction. $X$ and $Y$ are index registers. We can use them as a reference for doing operation. As an example for moving a block of data, the $X$ register can point to the next data byte to get and the $Y$ can point to the memory location to which the byte is going. $U$ and $S$ are called stack registers. A stack is a portion of RAM reserved for the microprocessor. The following is a summary of the microprocessor's registers.

X-Index Register
Y-Index Register
U-User Stack Pointer

## MAGAZINE for color computer users.

* Programs for business, home management, self-improvement, games, and utilities
* Reviews of Color Computer products
* Tutorials on programming in Assembly, C, Pascal, and Basic
* Contests

As an introductory offer, you can order the first year of SPECTROGRAM Magazine at 40\% off the cover price. For $\$ 18$, you will receive 12 issues of the magazine that could become the most informative addition to your Color Computer system.
We want to establish a line of two-way communication bet ween our staff and our readers as an aid in serving your needs. Please enclose any comments or special requests with your subscription form.

GROUP RATES: \$15 with orders of five or more subscriptions!

The 6809E microprocessor was developed by Motorola. The instructions are confusing if you are not familar with microprocessor terminology. We want to explain what the terms mean so that you can read the data sheet and have a good idea of what it says. The registers contain the important information that the microprocessor uses. The microprocessor either uses the information in the registers or goes to a location designated by a register. The next machine code to which the PC is pointing determines what is to happen next.

It is not hard to write simple routines with a 6809E microprocessor. However it is necessary to understand how the microprocessor operates and the tools we have available.

## Interrupts

Interrupts stop the microprocessor from doing the task it is doing, and assigns it another task. Depending upon the type of interrupt, it is possible to continue with the first task after the interrupt. We are all familiar with the rear reset push button. When this button is pushed an interrupt called FESET is enabled which causes the computer to go through its initialization routine. When the computer is first turned on, the RESET interrupt is activated. This forces the microprocessor to go to memory location 655.34 (羊FFFE) for the address of the FESET routine. This address is contained in the basic FOM along with the reset routine. Next month we will continue
and take a few of the microprocessor's commands with examples. We will also discuss more of the computer's architecture.

## INTERFACING COMPUTERS (Part 3)

You have a complete color computer system with disk drives, printer, and numerous software. You have had your eye on a second computer for some time, and finally you purchased it. Wouldn't it be nice if information could be transferred between the two computers? What if the second computer is a different type such as an IBM PC, Apple, or a Commodore 64?

Can basic programs be transferred between two computers of different types? The purpose of this series is to answer these questions and show what can be done. We have been looking at serial ASCII. This involves transferring one bit at a time from one device to another. This can be slow or relatively fast depending upon the transfer or baud rate. The baud rate is the number of bits per second and can go as high as 9600. The cassette works at about 1500 baud so 9600 baud is over 6 times as fast as the cassette.

Information can be transferred between computers in different cities by using a modem and a telephone line. A modem converts electrical voltages to tones and tones to electrical voltages. Tones are required to pass information through the telephone lines. These are usually slow and run from $\mathbf{3} 0 \mathrm{D}$ to 1200 baud.

Terminal programs are used to transfer programs and data between two computers. We mentioned transferring basic programs. For two color computers
we can transfer each byte in the program designated by the vectors in locations 25- 28. For other computers that use Microsoft Easic, programs can be trnasferred in ASCII format. However, the commands must be compatible. Some computers use different commands than others although they essentially use Microsoft Easic. As an example the color computers use the command PRINT\#-2 to print to a printer while many computers use LPRINT.

For transferring text files you do not need to be concerned about compatibility because ASCII is the same for all computers. Basic programs can be transferred in ASCII format and the computer reconstructs the Basic tokens or codes so the program can be run.

## INITIALIZATION

To use serial ASCII both the sending computer and the receiving computers must be in agreement. They both must know the baud rate, word length, number of stop bits, and the type of parity used. A start pulse is sent to synchronize the transfer. The data bits, the parity bit, and the stop bits follow. The receiving computer reconstructs the byte and processes it before the next byte or word is sent.

## COMPUTER to PRINTER

When a serial printer is to be connected to a color computer, the parameters mentioned earlier have to be set. Most printers just require a baud rate adjustment. For color computers, the values in locations 149 and 150 determine the baud rates. These values can be determined from your manual. Common values are 1, 187 for 300 baud; D, 87 for 60】 baud; and 0,1 for 9200 baud.

## HANDSHAKING

Handshaking allows the computer to be stopped by the output device. If data is being sent too fast for the printer, it can stop the computer until the data in its buffer has been printed. Then the printer can ask for more characters to print. If a printer has a large buffer or spooler, then it can receive a block of characters into its buffer and release the computer to do work while the characters are being printed. Most printers have at least a buffer equivalent to one line of characters. Some have buffers up to 哌 and larger.

## 25 Pin RS-232

Most RS-232 devices contain a 25 pin plug. A mating connector with proper wiring to mate with the 4 pin connector on the rear of the color computer is required. The wiring of the plug is standard except for the handshake. The following is a chart of a standard RS-232 pin assignment for the most common pins. This is what you can expect to find on computers, printers or modems.

| Fin | Description |
| :--- | :--- |
|  |  |
| 1 | Protective ground |
| 2 | Transmitted Data |
| 3 | Received Data |
| 4 | Request to Send |
| 5 | Clear to Send |
| 6 | Data Set Ready |
| 7 | Signal Ground |
| 20 | Data Terminal Ready |

For a color computer the pins are:
1 - Yellow- CD or Handshake
2 - Green- Receive data
$\mathbf{3}$ - Red -
4 - Whiteund

- Send Data

Two color computers can be

Put yourself in control! Define your ovn files - not someone else's.
Keep track of addresses, magazine artioles, programming hirits, whatever. YOU decide. Speedy ML routines handle record data entry, editing, review/search features, sorting, and
ERROR trapping. Numerous hardoopy options: font choices, rnsiling labels, page formats, and a separate program to convert files for use with most word processing programs! Verify tape saves to insure good data. File appends include ML safeguards agairist 1\%, O/S, and O/M errors!

## PAGE - 1 <br> PROGRAM DEVELOPMENT

In our 1985 October issue we showed how to place a program in memory bel ow the keyboard buffer. Since page $\triangle$ is normally considered the lowest beginning operating location above the keyboard buffer, we designated the lower operating location as page -1. The memory from 500 to about 720 is generally not used and can be used for data or a small program.

Have you ever been working on a program and for some unexplained reason the computer went through a hard reset and wiped out your program? You try listing the program and only get an ロK on the screen. The program is still in the computer but the vectors have been modified so that the program appears to have been erased. If you have extended basic and a disk drive you will see the following values if you look at locations 25-28:

| 25 | 26 | Value | 27 | 28 | Value |
| :--- | ---: | ---: | ---: | ---: | ---: |
| 38 | 1 | 9729 | 38 | 3 | 9731 |

Many times we have discussed vectors or pointers. For review a vector takes two bytes and points to a memory location. The value of the vector is determined by multiplying the lower byte by 256 and adding the upper value. Thus a vector consisting of components 38,1 will have a value of $38 * 256+1$ or 9729. The vector in location 25 points to the beginning of basic and the vector in location 27 points to the end of basic. The length of the program can be calculated by subtracting the values of the beginning and ending vectors.

BASIC PGM STROCTORE
We can recover our basic pro-
gram if we can restore the vectors. Let's look at the organization of a basic statement.

The first byte is a zero. The next two bytes contain a vector that points to the memory location of the next statement. The third and fourth bytes contain a vector which is the statement number. A chart showing these relationships follows:

MEMORY VALUE

| $M$ | 0 | Statement Follows |
| :--- | :--- | :--- |
| $M+1, M+2$ | $X$ | Vector to next stmt |
| $M+3, M+4$ | $Y$ | Statement Number |
| $M+5 T 0 K$ | Commands |  |
| $K+1$ | 0 | Statement Follows |
| $K+2$ | $Z$ | Next Statement |

Now let's take an example with numbers.

| MEMORY | VALUE | VECTOR VALUE |
| :---: | :---: | :---: |
|  |  |  |
| 9728 | 0 |  |
| 9729 | 38 | 9749 |
| 9730 | 21 |  |
| 9731 | 0 | 10 |
| 9732 | 10 |  |
| $\times X$ |  |  |
| $\times X$ | 0 |  |
| 9748 | 38 | 9773 |
| 9749 | 45 |  |

Notice that the $\square$ has a dual purpose. If location 9728 is the first statement, then the 0 precedes the statement. The $\square$ in 9748 means the end of statement 10 and the beginning of the next statement.

After the computer went through the hard reset, the values in 9729 and 9730 would be ©. If we can restore this vector then we can list the program. If we are to do any editing or save the program, we will have to restore the end of program vector in locations 27 and 28.

## RESTORING the FIRST VECTOR

Since all bytes, after the
first 4, have values greater than zero, we can look at the value stored in each location until we find a zero. The next memory location after the end of basic $\square$ will be the start of the next statement. The value of this vector should be in the first two bytes of the first statement. We can convert a memory location $M$ into the two vector components with the following equation:

## (1) MS=INT (M/256):LS=M-256*MS

To find the value of a vector from its components use the following equation:
(2) $\nabla=256$ * MS + LS

Our procedure will be to skip over the first 4 bytes at the beginning of the program and begin looking for a $\rrbracket$ to indicate the end of the first statement. The first vector in the first statement should point to the beginning of the second statement. The memory location after the $\triangle$ is the required memory for the vector in the first statement. knowing this memory we can determine the MS and LS from equation (1) and poke these values into the first two bytes of our program. For the numerical example we gave, these would be the values in 9729 and 9730.

After the beginning vector is restored you can list or run the program, but you can not edit or save it until the end of program vector is restored.

## RESTORING END of BASIC VECTOR

After the first vector is restored, continue looking at each statement until you find two zeros after the end of basic zero. In other words you will a vector that has a value of 0 for the next statement. This is the end of the program and this memory value can be converted
into its MS and LS components by using equation (1).

## BASIC PROGRAM RESTORER

This program will restore a basic program. A page -1 program must be less than 200 bytes. We had to remove all comments to be able to reduce the size. Since we have discussed the requirements for restoring a basic program after a hard reset, you should be able to follow what we did.

After the hard reset FOKE 25,2 to use the page -1 location. Then load in the program. It will ask you for M. This is the most significant byte of the erased program. For disk basic this is 38 if you did not do any FCLEAF commands. It is aiways a good idea to know where your program is residing in memory. Do a FEEK (25) to find out where it starts. The starting memory will be S=256 * FEEK (25) + 1. A 1 is always in location 26 so you can just add 1 instead of doing a FEEK (26).

## RESTORE <br> PAGE -1 PROGRAM

The following program will restore the vectors for a basic program after a hard reset. To use the program FOKE 25,2 and load the program. Then run it and do the memory pokes printed on the screen. Each statement's memory location will be printed so you can see what is happening.

1. FGGM 5-1-8'. FEESTORES A EASIC FFiOGFAM AFTEF A HAFD FESET. FiEMOVE FiEMAFiKS FOF FAGE -1. COFYFIGHT (C) 1986 EY DYNAMIC ELECTFONICS INC.
2 INFUT"M"; X: $\mathrm{B}=256 * X+1: M=\mathrm{B}+4: \mathrm{GOS}$ UBS: FOKEE, S: FOKKEE 1 , T
כ FFiINT"M="M:M=M+4:GOSUES: IFV $\$ DT HENS
4 M=M+2: GOSUES:FRINT"FOK:E27"S,"F

OKE28"T-1, "POKE25"X: END
5 A=PEEK ( $M$ ): $M=M+1: V=256 *$ PEEK ( $M$ ) + PEEK ( $M+1$ ) : $\mathrm{S}=\mathrm{INT}(\mathrm{M} / 256): T=M-256$ *S: IFA>ロTHENSELSERETURN

To use the program remove statement 1 and (C)SAVE "RESTORE". Then when you loose a program POKE 25,2 and LOAD and RUN "RESTORE". You will have to enter the most significant byte in location 25 of the program that was erased. The program corrects the vectors for the erased program and prints values for you to poke to correct the basic vectors. You can list the program and it is a good idea to save it before trying to run it again.

You can test RESTORE by loading a program. Then POKE 113,0 and push the rear reset button. The program is lost. You can now use RESTORE to recover the program.

## EDITOR*S COMMENTS

This month we are concluding our large memory series. In this series we showed how to use the extra 32 K memory bank in 64 K computer. The second bank can
be initiallized for basic and a program placed it it. You can then place a program in the first bank and go from one program to the other by exchanging banks. We also devel oped a ramdisk program for storing programs in the second bank and gave machine language subroutines for transferring data between the two banks. Also we covered the all ram mode and showed how to store a program in the upper memory.

This month we are starting a series on machine language (ML) programming. If you have wanted to know how to program in ML, now is you chance. We have been very successful in writing our programs in basic and using ML subroutines when we need something that basic does not offer such as speed. We will define the terms, talk about the microprocessor's architecture, and show how to assemble the codes. This will help if you have an assembler and are confused about how to use it.

We are looking at some hardware projects. This is not as easy as software. For example you can not damage your computer with a bad statement, but you can damage it if you drop some solder across pins on one of the integrated circuits. Hardware projects that plug into the casseite, printer, joystick jacks, do not require going inside the computer.

We appreciate the letters we have received and are using them as guide lines for future subjects. If you have a subject you would like for us to cover or a question you would like for us to answer, please write us a note.

Last Fall we discussed using Page -1. This is unused memory below the keyboard buffer from 512 to about 720. In this issue we have a page -1 utility that will restore a basic program after a hard reset. We are interested in receiving page -1
programs，and will pay $\$ 5$ for each we publish．They should be less than 200 bytes long．So if you have a short program，see if it will work in page -1 and send it to us．

Also in this issue we are in－ cluding a summary of all arti－ cles and programs we have pub－ lished．This can serve as a quick reference for finding material on a subject．

## LARGE MEMORY PROGRAMS （FINAL）

In this series we have shown how to write programs for memo－ ries larger than $32 k . \quad$ Most pro－ grams are designed for a उ2k computer．If you have a 64k， 128k，or larger computer then you have to modify or write your own programs．We used the sec－ ond memory bank in a 64k compu－ ter as our example for program develapment．

## 2 BANK MODE

We gave machine language sub－ routines for partitioning the computer for two bank operation． If the first bank is transferred into the second bank，then basic can be run in the second bank． A उ2ド program can reside in each of the two banks with both being accessible．The basic，extended basic，and disk basic read only memories（ROM）are available with each bank．They occupy the upper उスk of memory．With this configuration you have a total of $96 k$ that can be accessed with a 64K computer．

We showed how to store data in the second bank．If you have a program that requires a lot of data，then this is a good pro－ cedure．We gave an address file program as an example．Depending upon the organization of the program，a total of $32 k$ of data can be stored in the second bank．It would be possible to

## ADVANCED BASIC PROGRAMMING AID

Now there is a product which integrates the most used utility functions for your COCO．It works with all Extended Color Basio COCDe， $16 \mathrm{k}, 32 \mathrm{k}$ and 64 k ．Look at the features available，no need for a toxt processor to create or change programs．Saves disk space and time because programs do not have to be eaved in ASCII format．
＊COPY COMPAND：Copy one or more statements in a program
＊HOVE COTHAND：Hove one or more statoments in a program
＊FIND COMPAND：Find a string and REPEAT FIMD for string．
－MULTIPLE EDITING SESSIONS： You cen edit two programs at once and MERGE all or part． This also allows you to RUN one pgm while editing another
－SCROLLING：Allows for down or up scrolling through pgm．
－AUTOMATIC EDIT：You can entor edit of current line without specifying the line nember．
＊Corpland KEYS：One koystroke entors most basic coumands．
－REPEATING KEYS：Auto repeat．
＊automatic line marbering： Set start and inorement．
－BASIC FORMATTING：ONVOFF control，for cesior reading of list／print multiple stmts
＊KEYBOARD CLICKER：ONOFF
－CLEAR KEy disable：onvoff

## Bangert Software Systems

P．O．BOX 21056
Indianapolis，IN 46221
store 18k to 20k in the first bank for a total of around 50k. or more of data.

The principles we presented could be used with larger memories. For example suppose you have a 256k memory that has a ramdisk. You can quickly move blocks of data from the ramdisk into your operating memory to do data search or manipulations. This would be the same as loading and storing files on a disk but would be many times faster. We developed a ramdisk for using the second $32 k$ memory bank for program storage.

## ALL RAM MODE

The all RAM mode configures the computer so that all of the memory is RAM. The ROM information is copied to RAM. In this mode the operating system can be modified. For a disk system the upper 8K of memory is available for use. Data can be stored in this memory or a program can be placed there. We showed how to do this last month. This mode only allows about 8K more of memory. Therefore the two bank mode is generally desireable over the all ram mode.

$$
+++
$$

## COMPUTER GRAPHICS (Part 15)

In this series we have been covering the Extended Basic Graphic Commands. Last month we looked at the GET and PUT commands. These allow us to move a figure from one part of the screen to another. We gave a program to demonstrate this.

This month we want to look at developing a drawing program. With it we will be able to move
to different parts of the screen with the arrows and draw the figures we have covered. The basic figures are a line, box, filled boxed, erased box, and a circle. We want the capability of getting a figure and putting it into another location as we demonstrated last month. Also we would like to have the option of saving a drawing on a disk or cassette. If you have a graphics printer with a graphics printer ML subroutine, then you can make a hard copy of your drawing.

## PROGRAM DEVELOPMENT

We will have a menu that does all of our required operations. While in the graphics mode we want to move in any of the 4 directions designated by the arrows. If we press any other key, we want to go to a subroutine and do the operation assigned to that key. Our keys will cause the following operations to be performed.

| Key | Operation |
| :---: | :---: |
| B | Draw a box |
| c | Draw a circle with the first point as center and the second the radius. |
| E | Erase the box defined by the two points. |
| F | Draw a filled box |
| I | Initialize first point |
| L | Draw a line |
| M | Menu |
| F | Print Coordinates of the points |
| $N$ | Clear the screen |

Our menu should allow us to do the following:

C Change the color
L Load a drawing
S Save a drawing
H List all options
This month we are doing the first part. We will be able to draw the function indicated by
the keys or perform the opera－ tion．This will allow us to make and modify a drawing．When the program is run you are asked to enter the initial point for $X 1$ and $Y 1$ ．The second point is made equal to the first by let－ ting $X_{2}=X_{1}$ and $Y 2=Y 1$ ．You are then taken to the graphics mode where you can begin drawing your figure．

We did not add the menu and will add it next month．The drawing is a little slow so we added sound to let you know that the computer received your pres－ sed key．Also we set and reset the points so you can see where they are located．If you want to move the first point P 1 then press the＂I＂key and it will be moved to P2 or the second point． This is like picking up your pencil and moving to another location．Comments are included so you can see what each section does．

## PRODUCT REVIEWS

This section is open to all producers and dealers of color computer products. We will review your product free of charge and write an editorial on the product. We do not use a rating system but will explain what the product does, and what can be expected from it. Any comments about the review from the firm submitting the product will be printed in a later issue.

## STRING VARIABLE EQDATION SOLVER

M. F. Estes Softhead Co. has a program that will solve an algebra equation. For example the program will solve the equation $A * X+B=C$ for $X$ without any numerical variables being given. The program will solve equations composed of the letters $A-Z$ and integers from 0-9.

The program is loaded and run. Options are given for selecting a PRINTER (1), FAST (2), FASTER (S) OR NOTHING (《<ENTER》). If you just want to solve the equation press "ENTER". The following appears on the screen.

## INFUT EQUATION THAT I SHDULD SOLVE---

The following was entered:

$$
Y+X-3 Z=-8
$$

The computer prints
FOLLOWING IS THE EQUATION THAT IS TO EE SOLVED $Y+X-3 Z=\square-8$

WHAT VARIABLE DO YOU WANT TO SOL VE FOR?

When Z is entered the following appears:

SOLVING THE FOLLOWING-
$Y+X-\xi * Z=0-8$

- FOR Z. MY SOLUTION OF THE

EQUATION IS
$Z=+(B+X+Y) / 3$
If you will go through the algebra you can verify that the solution is correct. Let's try another equation.

$$
5 W-8 P+3 Q-5=0
$$

Solving for $P$ the computer's result is

$$
P=-(5-3 Q-5 W) / 8
$$

This is fun let's try another one.

$$
A X-3 Y+6=0
$$

and the solution for $Y$ is:

$$
Y=+(6+A X) / S
$$

The program will also arrange a higher order equation into descending powers from left to right. For example the equation
$5 x-8 x^{\wedge} 3+2 x^{\wedge} 2-9=0$
is rearranged by the computer as

$$
-8 x^{\wedge} 3+2 x^{\wedge} 2+5 x-9=\emptyset
$$

when asked to solve for $X$.
We tried putting a variable in the denominator with the following equation:

$$
A+B / C *(A+1)=\square
$$

When asked to solve for C the computer's result was:

$$
C=-B(1+A) / A
$$

The computer can generate an equation. For example we ran the program and selected the option for the computer to generate an equation. It generated the following equation:

$$
E *(F+B)-E * A+B=\square
$$

The solution for $A$ is

## $A=+(B+E B+E F) / E$

The computer will continue after a pause and solve for another variable or generate a new equation.

We found the program to be excellent for solving equations within its limits. The computer takes a long time to solve some equations. It is fairly fast for the simple equations though and makes a good learning program for those studying algebra.
M. F. Estes Softhead Co., F. D. Box SJS, Elba, NY 14058 , $\$ 19.95+\$ 35 / H$.

## NEW PRODUCTS

This section is available free for producers and dealers of color computer products. These products have not been reviewed by us but are included for our reader's information.

## PRINTER RIBBON INK SPRAY

As the demand for printed copies from data increases, so is the cost of fabric ribbon replacement. EBONIZE can greatly reduce these costs by extending the ribbons' useful life. One can of EBONIZE can re-ink up to 20 ribbons. Simply remove the toop of the ribbon cassette and spray even'y and lightly over the coiled ribbon. Its specially formulated ink permeates the ribbon surface by osmosis. After the ribbon is dry, replace the top and you're ready for re-use. Get longer life from your fabric ribbon with EBONIZE.

For more information contact Gold Filug 80-E.A.F. Co. F. O. Box 14, Keller. TX 76248 (817) 498-4242. $\$ 14.95$

## QUESTIONS \& ANSWERS

These are questions that have been asked us through letters. If you have a question, please write and we will print your answer here. For $\$ 10$ we will give you a personal reply to your question. Letters that are of interest to others will be printed here.

Question: I purchased a printer that uses a different type parity than my computer uses. About half of the characters are erroneously printed. What can I do to correct this?

Answer: Most printers have switches for selecting the baud rate and parity if used. I assume you looked for swi tches. This can be corrected in your computer by modifying the output printer routine to give the parity your printer needs. A machine language subroutine would have to be made and loaded whenever you needed to use your printer. Another approach would be to contact the printer manufacturer and see if they or one of their representatives can tell you how to change the parity.

## OPERATING HINT

You can break a program, do memory peet:s or pokes, or list part of your program, and then continue the program by typing "CONT ENTER". You do not loose your variables with this procedure.

## SOFTWARE THAT DOES SOMETHING!

NOT SHOOT-EM-UP GiAMES not another lanciuacl NOT MORE UTILITIES

ANKIA RESEARCH Software
lets your Color Computer do something for you NOW!

Our PROFESSIONAL 3-D PLOTTER ${ }_{\pi}^{\prime \prime}$ will diaw a "landscape" in 6 seconds! This ML program lits you generate the surface using BASIC and almost instantly your picture appears. \$24.95
Our SPECTRUM ANALYZER ${ }_{H}^{4}$ will calculate a Fast Fourier Transform (spectrum) over 10 times faster than BASIC. $\$ 24.95$

Do you run a small business or a large home? PROPRIETOR'S ACCOUNTANT is a complete double-entry bookkeeping system. $\quad 32 \mathrm{~K}$ Disk Only $\quad \$ 29.95$

## WE'VE TAKEN THE WORK OUT OF SOLVING YOUR MATHEMATICS PROBLEMS!

Wu you have a series of points thal you want fit to a line or corve?
Get FUNCTION FINDER• \$12.95
Du yosu want to sulver an e'guation or a set of linear equations? You need

## CIASSIEIED ADS

1. 10 cents a word, $\$ 3$ minimum.
2. Name, Address, \& Telephone listed free.
3. Send payment with ad.
4. Closing date 1st of the preceeding month. Ex. Nov ad closing is Oct. 1.

DISPIAY ADS
(Rate sheet 2 - March 1986) Closing $15 t$ of preceeding month.

| Pages | 1 time | 2 times | 3 times |
| :--- | :---: | :---: | :---: |
|  |  |  |  |
| $* 2$ | 25 | 23 | 22 |
| 1 | 30 | 27 | 25 |
| $1 / 2$ | 23 | 20 | 18 |
| $1 / 3$ | 19 | 17 | 15 |
| $1 / 4$ | 15 | 13 | 12 |

* We can use colored paper at no extra charge if ads are on both sides.

We can do ads in Fied, Blue, or Brown. No all one color ads will be accepted. For color ads send artwork for each color. Add 40\% for each color. Example: Dne page black and red for 3 times costs 丰25 + $10.0 \square=$ 丰 35.00 each month.
