Having a Ball in Florida Editor:

I recently sent in for a subsription to THE rainbow, and I want you to know the reason. I walked into my local Radio Shack store to purchase a set of joysticks for my CoCo 2. As I wrote my check, the store mananger handed me the September issue of THE RAINBOW and told me to have a ball. It was my first meeting with The rainbow, and I did have a ball. I went home and sat right down and entered Color Ball. I am a 55 -year-old kid at heart and the games fascinate me. I sent for the two most recent game issues and I am literally having a ball.

Thank you. I found my pot-o-gold.
Ray Atwood
Naranja, Florida

## Support for the Community <br> Editor:

With regards to Jim Price's criticism of your OS-9 articles in the September issue, I think his suggestion that you ignore $\mathrm{OS}-9$ is ludicrous. os-9 is a major parr of the CoCo Community and without it the CoCo , and THE RAINBOW itself, might have died long ago. We should not have to purchase another magazine for os. 9 articles, as he suggests, when os -9 is such an important part of the CoCo . Moreover, his suggestion ignores the financial contribution OS-9 vendors make to the rainbow through advertisements.

The reduction in size of The rainbow is due not to os. 9 as he implies but to decreased revenue from advertisers. This is caused in part by people like Mr. Price who do not buy the rainbow and do not support it or its advertisers.

If Mr. Price wants "good useable material,"I suggest he support therainbow, as well as its advertisers, and try os -9 . Once he sees the power of os 9 he may develop an interest in it just as I did.

Bruce Arsenault Cleveland, Nova Scotia Canada

## The Educated CoCo

## Editor:

I am a gullible 63 -year-old woman, but I don't believe what just happened on my CoCo 3 . I was using your hint in the January 1987 issue (Page 148) to make print-outs of disk directories. I got tired of all the typing required for each disk, so I typed: 10 POKE 111. 254: DIR and then used RUN.

By mistake. I used it on a Dos disk and got some lines of garbage. When I used it on my next disk, the directory listings were underlined. This was even better and easier to read, but I couldn't figure out what had happened. Being nosy, I listed my original line 10 and this is what I saw;

10 POKE 111,254;DIR
20 FOR N-\&H16128 to 8 H 20480
Where did Line 20 come from and what does it mean? Is my beloved CoCo 3 taking over the tedious job of programming to save my arthritic fingers? Do you think it might eventually write a program for winning the Florida State Lottery? Please explain.

Mrs. Dorothy Topping<br>3400 S.W. Dunklin Avenue<br>Okeechobee, FL 34974

To avoid a lot of technical jargon, the gobbledegook on the DOS disk dinged the BASIC interpreter. This flaked your program and sent some codes to the printer telling it to underline. (You can probably duplicate this by sending the codes yourself.) It isn't a miracle cure for arthritis, but we suppose this random happening could result in a winning tottery number.

## Powerful Connections

## Editor:

Is it possible to modify a CoCo 3 for use with the British 240 -volt, $50-\mathrm{Hz}$ power supply and 625 -line PAL TV standard using the RF modulator and transformer from a CoCo 2 sold in Britain? If so, how would Id dothis? Are there any companies that would make the modification for me?
P.R. Marlow so Lime Avenue Bentley, Walsall
West Midlands, GB. WS2 OJP
For information on using the CoCo overseas, refer to "CoCoing Abroad" (November 1987, Page 32) by Marty Goodman and Don Hutchison.

## The CoCo Supports Him

## Editor:

I'm a handicapped technician and I can't justify the expense of expanding my Tandy HX. In fact, my printer stays pretty much switched to my CoCo. My present employer runs a Únix system, as did my last

## Slots \& Cards

©

576 S. Telegraph
Pontiac, MI 48053
" (313) 334-5700

Did you ever dream of visiting VE(iAS, but you weren't sure what to expect - or if you would be able to afford it? Well. now you can play your favorite slot machine, or sit down at the blackjack table without even leaving the comfort of your home. Browse through different style slot machines (many different Multiplier slots). Visit the change booth if - or is that when? - you run out of cash, without feeling a pain in vour wallet. Walk around the corner and sit down at any of a number of different style card games. Einjoy video five card draw poker - where it takes jacks or better to win. Or play Blackjack against the ever treacherous house dealer. Play Hi-Low and wager the max every chance you get. Do you like Keno? If so, choose your numbers, then sit back and wait to see if they are drawn!

All versions display vivid true to VEGAS graphics. Whatever your game. Slots \& Cards has it for you! Slots \& Cards is available for the IBM PC \& Compatibles. Commodore Amiga, Atari ST and the CoCo III.

See your local dealer for orders and information or call us directly
three employers. Maybe I can soon afford OS 9 and learn more Unix-type skills.

Ilove this 512 K CoCo 3 system. I bought CoCo Max 3, Max 10, Color Graphics Designer Plus and Simply Better. I use them daily, along with several Rainbow programs that I've modified. I keep an $800-$ item wordbase inventory under Simply Better that is more flexible and much faster for my uses than dBASE or Unix.

I'd rather put my dollars in this CoCo. I've got a family, bills and little time for fooling around. I wish Radio Shack treated me a little better for the money I've spent. And I wish IBM vendors were as good as the CoCo's. I think what some clerks call "their kid's computer," in addition to my subscription to the rainbow, gives me the biggest bang for the buck on this planet.

Michael Cormier
Ft. Myers, Florida

## Upgrading the CoCo

## Editor:

I want to buy a disk drive for my CoCo 3 and to upgrade the memory to 512 K (it now has 128 K ). At present I use a tape recorder to store my programs. I want to order my disk drive out of THE RAINBOW. I really enjoy reading the rainbow and want to order RaINBow ondISK. What is the size of the disk?

Could you tell me what is compatible with my CoCo 3 in the line of a disk drive and upgrade kits.

Bennic Lutrell 314 Bird Circle Greeneville, 7N 37743

RAINBOW ON DISK is produced on $5^{1 / 4}$-inch floppies. Several advertisers in the rain. BoW offer $5^{1 / s-i n c h, ~ D r i v e ~} 0$ systems. Just compare the prices. Similarly, the 512 K upgrade is fairly standard from advertiser to advertiser. For specifics on upgrades, see "Upgrading the Color Computer's Memory" by Marty Goodman in the March 1989 issue.

## The Great MPI Hunt

## Editor:

Radio Shack in Fort Worth suggested you might be able to help me locate a MultiPak Interface (Cat. \#26-3124). I understand it is needed to operate my old disk drive with a new CoCo 3.

1 would appreciate having a list of your vendors that could help me in such a search. Thanks.

Robert Heyl
8983 Eastview Drive Allison Park, PA 15101

Yes, the MPI is a difficult animal to locate. Check with Computer Plusto see ifthey can
help you out. Or perhaps another reader can solve the problem for you.

## Looking to Ham it Up

Editor:
I am in desperate need of locating software for the CoCo to manage my ham shack. I had a CoCo 1 that I used for RTTY about five years ago. In the last four years I put hamming and computing aside to pursue my trade as an ironworker. I recently became active again with both hobbies.

After much debate with and ridicule from other hams, Idecided to buy the CoCo 3 rather than an IBM. For some unknown reason I wanted to support the CoCo. I now have a CoCo 3 ( 512 K ), two floppy drives and OS-9, but I have very little software for the ham radio. I need to locate more ham software and would like to interface my Kenwood 440 transciever to my CoCo . I feel I've done my part to support the CoCo. Now will the world of CoCo please help to support me? Any information on this matter would be appreciated. Perhaps you could help me locate Steven Ford and any other ham-CoCo enthusiasts.

> Dean Maluski
> 27 William Street
> New Britain, CT 0605I

As published in the February 1990 issue, Steven Ford can be coniacted at 12 Foxbridge Village Road, Branford, CT OG405. Another source of ham information is Dale Puckett, author of "kissable OS.9."

## Protecting Protection

## Editor:

I read about the Reset protection routine in the July 1990 issue of THE RAINBOW and at the time thought ' 1 won't need that.'

Of course now I need to use Reset protection. I also need a Break/Escape protection routine as well as the ability to restore all of these functions without turning off my CoCo 3 . I am developing a password protection scheme, but it only protects one program. I would like to modify this so that my password will protect an entire disk from unauthorized access. Any helpful hints and advice will be welcome.

Joan Claso
2480 Lazy Landing Drive Redding, CA 96002

## 68000s Unite!

## Editor:

I recently attended a computer fair at Purdue University where I gathered information about Amiga, Macintosh and Ms-Dos-based systems. When I looked through the information about the Amiga and Macintosh systems, I noticed these sys-
tems use the 68000 and 68030 CPUs, similar to the new 68 K OS 9 systems offered in THE RAINBOW. I wonder if these systems have any similarities and, if so, is there any compatibility between them. I want to purchase a new system, but fear I might be leaving the CoCo family. Is there any hope?

Kevin Bump
741 San Ricardo Drive
Greenwood, IN 46142
There are myriad hardware differences berween the Macintosh, the Amiga and the computers on our horizon. Still, os-9 provides a good foundation for compatibility, and OSK (OS-9 for the 68000 series) is available for all these machines.

## Sound Trax Update <br> \section*{Editor:}

I've received a few letters from people having trouble booting their SoundTrax disk. It seems that some oider drives tend to be unreliable and have problems with the SoundTrax loader. For this reason we have slightly reprogrammed the loader to be a little more understanding of these drives. While we were modifying the loader, we decided to make a few other suggested changes. First, the program can now be booted from any drive instead of the normal hard-coded Drive 0. It also recognizes double-sided drives so you can access drives 2 and 3 as the flip sides of 0 and 1 . For those who have purchased SoundTrax either through us or a dealer and have the aforementioned booting difficulties, or simply want to upgrade to Version 1.01 with the minor additions, please send the original disk along with your receipt and $\$ 5$ to cover time and S/H. We will rush the upgraded disk to you. Thank you.

> Glen R. Dahlgren
> Sundog Systems
> Manassas, Virginia

## Kudos

## Editor:

It may be of interest to you that, as a result of your publication of my letter in the May issue I have received replies not only from some American readers, but also from Brazil and Australia.

Here is a quote from your Brazilian reader:
"Unfortunately, the CoCo (compatibles) was discontinued here in Brazil and the only support for us is through the THE Rainbow. At my work I use many programs that appear in this magazine and the results that I obtain have stimulated me very much!"

After that he gives a list of yarious

# Unto What Far Harbor? 

Just a few minutes ago I finished reading Allen Drury's new novel Toward What Bright Glory?, the first in a series of novels expected to follow a group of college students from the year just before World War II to the present day. Drury is excellent at writing series novels, and his first work in this series holds much promise.

I hope when I write my long-planned novel I can create as thought-provoking a title as this former Pulitzer Prize winner (for Advise and Consent) has here. This book's title and the book itself, including the final paragraphs from which the title comes, have universal appeal. Even though Drury writes about the issues of war and peace, the shaping of lives, the maturing of people and of nations, his title is one that can apply to almost any human endeavor.

As I finished reading the final page and reluctantly closed the book (already wishing for the second one), I thought about our own CoCo Community. In this book the class of ' 39 , merely three months from the bosom of their university, came face-toface with what Mr. Drury terms "the hounds of hell" unleashed on the world by the fanatic Nazi Germany. We, in the CoCo Community, are also sometimes beset by trials of our own. While our issues may not be as world-shattering as those in Drury's book, they are nonetheless important to those affected. And even though we are not under siege from a foreign power, my mail indicates a perception that our Community's way of life is no less threatened. I do not see this threat.

We are the possessors of an amazingly sophisticated computer system. We are embraced by a caring and interested Community. There are new options on the horizon with more powerful machines that will allow us to "Keep on CoCo-ing." And a growing number of small developers who need our encouragement. Ours is an ancient (as computers go) and proud heritage on which we can only improve.

Toward what bright glory do we aspire? Touse our CoCos, to pass them on to others and to share our information and knowledge. All of these are possible for each of us. And for our CoCo Community as well.

1 must address some of the concems expressed recently in my mail. I realize mail is not necessarily an accurate reflection of a total Community, but often those who voice their concems speak for many others who are no less concemed but choose to remain silent. So, for concerned parties of both groups...

There is no intention, plan, idea, concept or anything of the kind to cease publication of THE RAINBOW. I don't know how these rumors get started. I've heard them for a decade. Yes, we depend on advertising revenue for the vast majority of our income and if advertising drops, so will the number of our pages. But if advertising revenues increase, our number of pages will also increase.

There are a number of ways in which you can help. One way is to support our advertisers. Even if you are not familiar with their product, try something new. Another way you can help is to subscribe to therainbow. It is very expensive to make our magazine available for single-copy sales. We are curtailing sales locations because there is actually a loss taken on every magazine sold. It is also less expensive to receive the magazine through subscription than to pay for each individual copy.

Many of you in the CoCo Community have been, and will continue to be, with us for a long time. One of the greatest mistakes made by the old 80 Micro magazine was to abandon its Model I and Model III readers. There are no such plans for the CoCo Community.

We cancelled our plans to publish the CoCo history book because the authors said that given their time constraints they would be unable to deliver it. We want to publish that book. We tried to find someone who would write it for us. And when
there was no other answer we refunded the money to those with pre-paid orders. We would still publish the book if an author is found. If you want to write it, please give me a call.

We absolutely plan to have RANBowfest in Chicago this spring. We have tried to encourage plans for one or two smaller fests this fall. These smaller fests will probably not be as successful as rainbowfest and participants should not be discouraged if they are not. We put a lot of punch behind our show. And, at least at this time, we feel it is better to have one big show per year than two.

We have every intention to continue our support of both Disk Basic and os-9. We believe both systems offer many educational opportunities. We will leave it up to you to choose whether or not to learn os-9.

You should understand that as a matter of policy (my personal policy) we will not support any other publication aimed at the CoCo Community. This is not a decision based on competition, it is a decision based on the difficulty of producing a magazine/ newsletter publication. Over the years there have been perhaps a dozen such publications. They have all gone out of business and left a bad taste in the mouths of many people. Some of the competition has been very large and well-funded. And some of them closed their doors at the very height of CoCosales. Each closing hurt our Community. I decided many years ago to never allow that to happen again.

I am personally optimistic about the Color Computer and the CoCo Community. There are things that can be done on a CoCo today that could not be done on a mainframe when the CoCo was introduced. To have that much user-friendliness, power and potential means your CoCo will be useful for many years to come.

And we intend to be part of that with you. Onward toward an even brighter glory!

- Lonnie Falk

Just think of aay word processing feature, chances are Word Power has it...packs a lot of features excellent word processor.." Word Proc. Comparisoa-April 1989 Raíabow; Pg 26

## Word Power 3.3

## The Best Just Got Better!

...frieadly...amazing exccution speed...much easier to use than VIP software \& 2 other systenss I've fried...very user friendly. bighent among word-processors"-Rainbow Oct 88 Rev.

## MEMORY

Word Power 3.3 allows 72K of workspace on a 128 K CoCo and
460 K on a 512 K CoCo. More memory than any other word processor. Period.

## EDITING

Powerful full-screen editor w/ word-wrap. 4-way cursor,scrolling; Line Positioning; Block Commands; Search, Replace; OOPs recall during delete, adjustable keyrepeat, key-click, typeahead, Tabs, Word-Count and much more! . Built-in extensive HELP sereen can be accessed anytime during edit.

## SPLIT-SCREEN EDITING

Freeze a portion of text and edit another. Its fantastic!

## DISPLAY

Choice of $\mathbf{4 0}$ or $\mathbf{8 0}$ columns with your choice of colors. Can be used with RGB Composite/Monochrome Monitors and TV. Pull down menus, plain english prompts, on-screen underlining and page break display make

CALCULATOR
Built-in 4 function calculator!

## 2 COLUMN PRINTING

Align your text in 2 columns with a tew keystrokes!

## SAVING / LOADING

Creates ASCII files that are compatible with other word-processors, terminal programs, etc. Allows directory point \& select for easy loading/saving, Automatic Backup, file erase, free space display. ARE YOU SURE? prompts prevent accidental deletes. The Auto-Save feature automatically saves text to disk during user-defined intervals for peace of mind. Supports double-sided drives.

## PRINTING

Works with all printers that work with the CoCo. Allows options such as baud rates, spacing, page/print pause, partial print, page numbering/ placement, linefeeds, multi-line headers/footers, right justification and number of copies. The values of these options can be changed in the text by embedding Printer Option Codes. The WHAT YOU SEE IS WHAT YOU GET feature allows you to preview the text on the screen as it will appear on the printer. You can view margins, page breaks,

## DOCUMENTATION

Word Power 3.3 comes with a well-written instruction manual \& reference card which makes writing with Word Power as easy as pie. Word Power 3.3 comes on an unprotected disk.

## MAIL MERGE

Type a letter, follow it with a list of names \& addresses and have Word Power print out personalized letters. Its that easy!

## SPELLING CHECKER

 Word Power 3.3 include a $\mathbf{8 0 , 0 0 0}$ word spelling checker which finds and corrects mistakes in your text.
## PUNCTUATION CHECKER

This checker will proofread your text for punctuation errors such as capitalization, dou-ble-words, a/an usage, spaces and more. Its the perfect addition to any word-proccessor.

Upgrade Policy: Word Power 3.2 owners can get Word Power 3.3 by sending original Word Power disk and $\$ 15$ to the address listed below.

by Mark Haverstock and Bill Wills

re you tired of home videos that look homemade? Those videos with titles and credits on hand lettered cards. Well, put away your markers, cardboard and rulers. Use the CoCo 3 to give your home videos a more polished look. With the right software and a few dollars worth of accessories, yours can be a professional creation with impressive titles, special effects and even some simple animation that can be added to your videos without expensive editing equipment.

## Composite Video:

The Link to Your vcR or Camcorder
If you look at the back of a VCR you will notice several jacks, including two marked Video In and Video Out. These jacks are used to make a direct connection to another video accessory, such as a monitor or another VCR. The signal is called composite, or baseband, video and contains the picture information to be displayed or recorded in a format known as NTSC (National Television Standards Committee). The informa-

Mark Haverstock and Bill Wills are amateur videophiles who hope to be successful on America's Funniest Home Videos. Mark is a teacher and Bill is a quality control engineer for a manufacturing firm. When not writing articles and reviews for computer magazines their spare time is spent on Delphi. Their usernames are DRDEBUG and BASICKID respectively.

tion can be transferred directly and does not need to be tuned to a television receiver.

When plugging a composite video source into a VCR, you can directly record that source. If you look on the back panel of the CoCo 3, you will see two small jacks labeled Audio and Video. These jacks are very similar to those found on the VCR. The CoCo 3 has a composite video output that can be displayed on a monitor or recorded on a VCR.

The CoCo 3 is a great choice for video titling. The RGB output can be hooked to the computer's monitor for previewing. The video output connects directly to the VCR's video input for recording as shown in Figure 1. Finally, the CoCo 3 can produce up to 16 colors at one time.

## Working With Video

The CoCo 3 has two video outputs, RGB and composite. These are quite different, so what is scen on the computer's monitor will not necessarily appear the same way on a composite monitor. What you see isn't always what you get. Color and text will differ in tint and clarity. We suggest you watch the image of your final creation on a television connected to the VCR.

Your pictures, titles, credits and animation will be incorporated into your video through separate scenes dubbed to your home video. These are strictly stand-alone sequences suitable for beginnings, end-
ings, intermissions and the like. They will not overlay existing video footage. In other words, you can't blend the graphics titles with pictures that already exist on your videotape. This would require expensive additional Genlock hardware.

Rather than record the graphics titles over the original video tape, we recommend you dub the works to a second video
recorder. This prevents accidental erasures on the original tape and provides some flexibility in editing your final production.
You can easily remove mistakes and poorly shot scenes for a more polished production.

A typical hookup diagram is shown in Figure 2. It consists of a CoCo 3 , a video switchbox or special effects generator, a playback VCR, a record VCR and a TV. If available, a camcorder can be used as the record VCR. Camcorders usually have multiple record heads and sophisticated editing features that may prove beneficial to the overall outcome of your video. An optional video enhancer or amplifier can be included to further improve the quality of your final copy. Audio mixers will blend narration and music for a pleasing effect.

The original footage runs on the playback VCR. Graphics and titles are generated on the computer. You can switch back and forth between the two to create a desired product to send to the record VCR.

You can build a video switchbox for about $\$ 5$ with paris from your local Radio Shack, or the Radio Shack Audio/Video Control Center (Cat. 115-1956) is a readymade unit that will work equally well. If additional editing features are needed, the Video Special Effects Switcher (Cat. \#151274) can handle fades, wipes and audio mixing.

## HEART \& SOUL

Breathe Life Into Your Color Computer. Gain complete conirol over your CoCo with these Pokes, Peeks in Execs Booka. The books will give you the power of Machine Language wilhout leaving the security of Basic. Each book is a collection of "inside" information with explanations and examples Everyone from the novice to the professional will find these books a weaith of intormation.

Rommel 3D: $\$ 34.95$. Exciting 3D Tank Combat Game.

Credit Card Toll Free Orderline 1-800-654-5244

When making your connections, be sure to use well-shielded video cable and keep the lengths as short as possible. This will assure a quality picture. Never use audio patch cords.

## Creating Your Presentation

First draw the graphics and add the titles you want using CoCo Max III. After you create the screen, change to the Scroll Page function in the Options menu. This erases
the outer border of tools and palettes so only the picture is visible. Revise if necessary and save on disk.

CoCo Show is a graphics viewer included with CoCo Max III that helps you

## Building an Audio/Video Switchbox

This audio/video switchbox is a great timesaver when dubbing from two sources. If you have to reach behind your VCR to plug and unplug cables when dubbing, you will appreciate the added convenience of having this switchbox.

Switchbox assembly is simple and requires only a few tools. You will need a drill. $1 / 4$-inch drill bit, screwdriver, flat metal file, wire strippers, pliers, soldering iron and solder.

You will also need a metal project box (Cat. \#270-239), six phono jacks (Cat. \#274346), a DPDT toggle switch (Cat. \#275-636), wire, and dry-transfer lettering, all of which are available from Radio Shack.

## Construction

First, remove the cover of the box and the four screws packaged inside. Mark the positions of the holes to be drilled in the top and sides (see Figure 3). Then mark the positions of the holes on the back of the box. Drill all holes using the $1 /$ 4 -inch drill bit. Use the file to remove any burrs from inside the box. Apply the dry transfer lettering or the optional template to the top of the box. Label the audio and video jacks. Mount the switch in the hole on the top of the box.

Remove the grounding tabs from the phono jacks. Mount each jack in the remaining holes in the back and sides of the box. Be sure to tightly secure the nuts on each so they form a good connection to ground.

Prepare six 3-inch pieces of wire by removing about $1 / 4$-inch of insulation from each end. Wire the audio/video output
lines from the two middle terminals on the switch to the jacks on the back of the box (see Figure 4).

Wire the remaining audio/video inputs to the switch as shown in Figure 4. Solder each connection carefully. Be sure to inspect the solder connections for shorts. Test your box by plugging in your computer and VCR as described. If necessary,
re-adjust the position of the switch to match the marked switch positions.

Finally, re-assemble the box by carefully tucking the wires inside. As a finishing touch, cover the dry transfer letters with clear nail polish to prevent them from rubbing off. Now you can enjoy the convenience of an audio/video switch for much less than commercially made units.

## RSDOS UTILITIES (for CoCo $1,2,3$ unless otherwise specified)

SUPER TAPE/DISK TRANSFER:\$24.95. Copies Basic, ML and Data flles from Tape-to-Disk, Disk-to-Tape, Tape-to-Tape and Disk-to-Disk.
DISK UTILITY 2.1A:\$19.95. Perfect tool for every disk drive user. Allows blazing fast file copy, kill, rename, directory sort, format and info on programs with extreme flexibility and ease. Very user friendly.
DISK LABEL MAKER: $\mathbf{\$ 1 9 . 9 5}$. Design professional labels with different borders, font styles, double strike and more. Supports DMP, Epson, Gemini, Star and compatible printers.
COMPUTERIZED CHECKBOOK: $\$ 19.95$. The perlect program to balance your checkbook. Add, view,

VALUE modlfy and print accounts for chacks, deposits and ATM transactions. Entries for Checking, Savings and other accounts.
HOME BILL MANAGER:\$12.95. Schedule your billing effectively. Allows you to enter, edit, load and save bills \& reminds you when due.
CALENDAR MAKER:\$12.95. Create annotated calendars, month by month. Memo feature allows "special day" reminders.
MAILLIST PRO:\$19.95. Create malling lists sorted by name or zipcode. Create, Edit, View, Print and Sort mailing labels.

COCO 3 SCREEN DUMP: $32 / 40 / 80$ column, PMODE $3 / 4$ dump. Allows you to take snap-shots of screens while program is running! DMP \& Epson/Gemini/Star \& compatibles. \$19.95 (CoCo 2 version incl)

# For the first time, a community has banded together to design their next computer -a revolutionary computer, designed 

 by you. The MMM/1.

## Power.

The Color Computerrm era began ten years ago with an affordable, upgradeable computer with great sound and graphics. The MM/1 $1^{\mathrm{Tm}}$ continues that tradition with powerful graphics, crystal clear sound, fantastic multi-tasking, and easy to use windows.

Excite your eyes with high resolution graphics that surpass the famed Commodore Amiga™. Mix in hot music with a MIDI musical keyboard or the built-in IBM PC style music hardware. Or buy the Extended System to play back digitally sampled horns, drums -- even your own voice! And the MM/1 will never be out of date, because its optional 32-bit bus has both the power you need for the future and the compatibility with PC hardware you need for today. In business and pleasure, the MM/1 is ready for you.

## Software.

Interactive Media Systems, Inc. is working around the clock to bring you the best of the MS-DOS ${ }^{\text {TM }}$ and UNIX ${ }^{\text {TM }}$ Software catalogs. New titles are being added each month. Ask for our catalog or for a subscription to The Insider newsletter to
find out about the amazing software support for the MM/1 -- support from the Color Computer, ST, Amiga, UNIX, and DOS markets.

For no extra charge, the MM/1 includes software worth over one thousand dollars: OS-9/68000™, C compiler, Basic, IBM PC File Manager for reading and writing DOS disks, tape backup support, print spooling, a graphics editor, and more.

## Specs.

The MM/1 is packed with features that make it ideal for business and home use. For $\$ 779$, you get

- slimline professional PC case with room for $2-5.25^{\circ}$ drives and 3-3.5" drives; includes 200 watt power supply
- one Megabyte of memory
- graphics resolution up to $720 \times 540$
- up to 256 colors from its built-in palette of 16.7 million colors
- PC style sound for exciting games and friendly business applications
- true multitasking operating system
- windows, applications, and utilities worth over \$300!
- 2 serial ports for printers, mice, terminals ...
- MIDI capable for the music hobbyist and professional

[^0]- built-in networking interlace for low-cost connection at 100 KBaud to over 120 other MM/1s! Perfect for school and business
- PC keyboard port for professional XT style keyboard
- Uses CM-8 ${ }^{\text {TM }}$ and dozens of other monitor brands
- 15 MHz CPU - runs circles around the Amiga!
- built-in graphics coprocessor for fast logic and pixel acceleration
- expandable with optional high speed bus
- high density 1.4 Megabyte floppy disk drive
- OS-9/68000 in EPROM for ease of use -- or you can boot off floppy or hard drive
- Direct Memory Access (DMA) for smooth access to floppies and hard drive while multitasking

The optional second board (the I/O Board) includes DMA SCSI host adapter, up to three more serial ports, two bidirectional parallel ports, powered serial mouse port, CoCo 8-bit analog joystick port, Realtime battery-backed clock, dual channel DMAable 8-bit sound ports for play and record, and memory expansion that brings a full system to 3 or 9 Megabytes! For ease of use, power, and multimedia, the MM/1 is the revolution you've been waiting for.

Only $\$ 298$ (add $\$ 12$ S\&H/\$40 in Canada)

Magnavox RGB Cable for CoCo 3 and Composite Video/ Audio Cable Set with Purchase of Monitor: $\$ 19.95$

# A Glossary of Terms 

## Scrolling

Scrolling refers to the movement of text horizontally or vertically on the screen. A common example of scrolling is the list of credits usually seen at the end of a movie. The new text appears on the bottom of the screen, works its way up and finally disappears at the top. Horizontal scrolling is also referred to as crawl.

## Animation

Animation is the process of making an object appear to move on the screen. Computer animation is accomplished by drawing, erasing and then re-drawing text or pictures with little or no pause time in between.

## Transitions

Transitions help to smoothly blend one graphic element of your script into another without the abrupt change from one scene to another. Some of the more common transitions are listed and explained below.

## Fade In

A fade in starts with a blank screen and slowly builds to show the complete scene. The effect is similar to standing in
a dark room and slowly turning up the dimmer switch to full intensity.

## Fade Out

The fade out is the opposite of the fade in. The picture starts at full intensity and gradually fades to a blank screen.

## Wipe

A wipe pattern begins by blocking out part of the existing picture and then slowly replaces it with the next picture. Visually a wipe is much like pulling down a window shade and revealing a new image. Wipes are usually from right to left, or from top to bottom on the screen.

## Cut

The cut is an instantaneous transition from one shot to another without the gradual change. A common example of the cut is switching between the images of two people filmed during a phone conversation.

## Genlock

Genlock is a hardware device that allows you to superimpose graphics or titles over an existing video picture.
organize your pictures. The pictures can be cued one at a time with movement from one to the other by using the spacebar. An optional automatic wipe feature provides smooth transitions from one picture to the next should you decide to use them. The sample screens on RAINBOW ON DISK were created by Bill Wills with CoCo Max III and are visible when loaded into CoCo Show. CoCo Show is provided on this month's RAINBOW ON DISK (courtesy of Colorware) so you can see examples of animated title screens.

Although we recommend you use CoCo Max III, other drawing programs for the CoCo can produce full-screen graphics suitable for video work. Examples of these programs include Color Max, The Rat and DeskMare. These programs' features may vary, but all can help create artwork or import pictures from clip-art disks to create your title screens.

## Editing Hints

Tape editing can be a time consuming
process. The object is to blend titles, special effects and pictures into an interesting and visually pleasing production with minimal blank spots and jumping in the final copy. Here are some hints designed to help make the editing experience a smooth one.

First load a new blank videotape into your record VCR and set it to record at its highest speed, which is SP on VHS recorders. Prepare the record VCR by simultaneously pressing the record and pause buttons. Use the pause button to stop and start the record VCR to minimize glitches in the final copy. Cue your videotape on the playback VCR and start a few seconds ahead of the scene you want to record. When the proper scene appears release the pause on the record machine. Press pause again after the scene. That's all there is to it. The pause can be left on for upto five minutes on most VCRS before it automatically retums to the stop mode. This should give you enough time to cue the next scene or a title screen.

Switch between the computer and playback VCR when the recording VCR is
paused. If you switch while recording, a glitch will appear in the tape. But, with a video special effects switcher you can wipe or fade between either input while the tape is still running. Be sure to preview your computer's video sequences before you record them. Sometimes a stopwatch is helpful when recording the running times.

As we mentioned earlier, dubbing to a second VCR or camcorder is the easiest way to edit. The finished copy becomes a second generation copy of the original video and will not be quite as clear as the first. For this reason you may want to consider a signal amplifier or video enhancer to improve the quality of your final copy.

Sometimes you may have access to only one VCR or camcorder or you just want to add titles to the original tape. If you must add titles to the original copy of the video, many of the newer VCRs have a feature (variously called Video Dub, Edit or Insert) that allows you to re-record a section of video on top of a previously recorded section. This is the mode to use when adding title sequences or graphics to your videotapes. The operation of these features will vary, so consult your owner's manual for more information.

## Older Color Computers

If you have a CoCo 1 or 2 with a color composite video adapter, you can still generate titles with CoCo Max, CoCo Max /I and other graphics programs. The connection will be the same as for the CoCo 3 . Yourcapabilities will be somewhat limited based on the graphics program you use.

The last and probably least desirable alternative is to tape the video directly from the computer monitor or TV. Although this process will produce an acceptahle picture in most cases, it may contain an annoying flicker due to timing differences between the camcorder and the monitor.

## Summary

The composite video output of your CoCo 3 provides the necessary link to your VCR with the capability to add titles, simple animation and video effects to your home videos. With the right software, a few inexpensive accessories and some skillful editing more polished home videos are yours. CoCo Max III is available for $\$ 49.95$ from Colorware, 242 West Avenue, Darien, CT 06820.

Fully assembled and TESTED. Our design allows a firm contact and mounting chips on top to prevent any heating problems. Fast 120 ns chips. No soldering; Easy picture instructions for 2 minute installation! Comes with following software (value $\$ 100$ ):

- 512K Ramtest - 512K Backup Lightning
- 512K Print Spooler -512K Ramdisk - OS9 Level II Ramdisk

The absolute best 512 K Upgrade Available! Only $\$ 94$ OK Board (with 512K Ramtest/Rarndisk/Spooler): $\$ 39.95$ 64K Upgrade (8 chip) for CoCo I, CoCo Il's with Cat \# 26-3026/3027/3134/3136: \$29.95
64K Upgrade (2 chip) for 26-3134 A/B CoCo II: $\$ 39.95$

## - 1 MEG 

- Upgrade your CoCo 3 to 1 MEG!
- Kit includes 512 K Memory and necessary Hardware
- Includes OS9 Drivers by Kevin Darling
- Requires 512 K CoCo 3 and soldering experience.

Zero K Kit: $\mathbf{\$ 1 1 9}$
1 MEG Kit: \$159

## BIG BASIC (from Danosoft)

Get 92 K from your 128 K CoCo 3 and 476 K on 512 K for Basic Program and variables!! Only $\$ 39.95$ Super Big Basic (for Disto 1 MEG Upgrade): \$49.95

## COMMUNICATIONS

 EXTAAVGGANZA $2400-$(1) ZOOM 2400 Modem: Fully Hayes Compatible 300/1200/2400 w speaker, Auto Dial/Answer \& Seven Year Warranty!
(2) MODEM CABLE (4pin to DB25; Reg $\$ 19.95$ )
(3) Autoterm Software (Peg $\$ 39.95$ )
(4) Free Compuserve Offer \& Access Time
(5) UPS 2nd Day Air Shipping

Only $\$ 169.95$
Zoom 2400 Modem: $\mathbf{\$ 1 2 9}$
Avatex 1200e Modem Only : \$85
Communications Extravaganza 1200: Includes
Avatex 1200 e w/ 2 Year Warr., cable, Compuserve
Offer, software \& 2nd Day Air Shipping. Only $\$ 109.95$

INTRONICS EPROM PROGRAMMER: Programs 2516, 27xx/xxx series and more! Includes software \& complete documentation. Latest version. CoCo $1,2,3$. Only $\$ 137.95$ DATARASE Eprom Eraser: For $24 / 28$ pin Eproms. Erases up to 4 EPROMs at a time. Only $\$ 49.95$
Both Eprom Programmer \& Eraser: $\$ 179.95$
2764 Eprom: \$8
27128 Eprom: \$9
ROMPAK (w/ Blank PC Board, $27 \times x$ Series): $\$ 12.95$
BLANK CARTRIDGE (Disk Controller Size): $\mathbf{\$ 1 0 . 9 5}$ Eprom Burning Service: $\mathbf{\$ 1 5}$ (Eprom Extra)

## KEYBOARDS <br> 6 Feet Keyboard Extension Cable. Have up 102 keyboards hooked up to your CoCo. Only $\$ 39.95$ <br> CoCo 3 Keyboard: \$39.95 w/Extension Cable: \$89.95 <br> CoCo 2 Keyboard: $\$ 19.95$ w/Extension Cable: $\$ 49.95$ (CoCo 3 Keyboard includes free Function Keys Software) <br> Magnavox 8505/8515/8CM643 RGB Cable: $\mathbf{\$ 2 4 . 9 5}$ Magnavox 1CM135 RGB Cable: $\mathbf{\$ 2 4 . 9 5}$ <br> Serial-to-Parallel Interface: Use your parallel printer at high speed ( $300-9600$ baud) with CoCo. Comes with all cables. Only \$44.95 <br> 15" Shielded Multipak Extension Cable: $\$ 36.95$ <br> Y Cable: Use your disk system with Speech/RS232 <br> Pack, DS69 Digitizer, etc. Only \$27.95 <br> RGB Analog Extender Cable: $\mathbf{\$ 1 9 . 9 5}$ <br> SONY Monitor Cable: $\mathbf{\$ 2 9 . 9 5}$ <br> MODEM Cable: 4 pin to DB25. Only $\$ 19.95$ <br> 2 Pos. Switcher: Hook 2 devices to serial port. \$29.95 HI-RES Joystick Interface: \$11.99

## CHIPS, ETC.

Genuine RS Disk ROM 2.1 (Needed for CoCo 3): \$29.95
68B09E Chip: \$14.95 68B21 Chip: \$5.95
GIME Chip for CoCo 3: \$39.95
Genuine RS Multipak PAL Chip w/ complete instruc-
tions (Specify 26-3024/3124): $\$ 19.95$
PAL Switcher: Allows you to switch between CoCo 2 \& 3 modes when using the Multipak. You need the OLDER \& NEW PAL Chip for the 26-3024 Multipak. Only $\$ 39.95$ With NEW PAL Chip Only $\$ 49.95$

## Wormy

by Dan Tandberg, M.D.

Wormy is a classic computer game rewritten especially for the Color Computer. The object is to steer the worm around the screen and eat the food. When the wonn eats, she grows longer and the game grows more difficult. The point is to create as long a worm as possible.

I wrote Wormy to run as fast as possible without resorting to assembly-language programming. In fact, at the most difficult levels the game is almost too fast to play. The listing is short enough to be entered in a reasonable length of time and has enough features to satisfy most users. It includes seven levels of difficulty, continuous score display, high score, sound effects and single-stroke restart.

The high degree of speed was achieved through a number of programming tricks, many discussed in prior issues of THE Ralnbow. The main loop was placed near the beginning of the program and calls to subroutines were kept to a minimum. Arrays were used generously to avoid repetitive calculation of frequently used values. The animation was accelerated by using pokes to text screen addresses rather than PRINT @ statements. Variables were substituted for often-used floating-point numbers since these seem to run faster. Complicated floating-point calculations were avoided wherever possible. And finally, BASIC statements were combined to further expedite program execution.

Enter the program exactly as shown in the listing and save a copy before running it. The few spaces that remain should not be deleted or the program will not run properly. The REM statements can be left out. If you have only 16 K of RAM you will need to enter PCLEAR1 before loading the program or you'll get an out of memory error when the large array, $\mathrm{A}(999)$, is dimensioned.

When run, Wormy shows you brief instructions on how to play. Choose your own level of difficulty. I recommend using Level 6 or 7 until you are comfortable at higher levels. The G and H keys move the worm left and right, respectively. The E and F keys move it up and
down. If you hit the edge of the screen or hit yourself, the game ends. The worm moves quickly, so keep your fingers placed lightly on these four keys at all times.

As you play, you'll notice some interesting features. The length of your worm and the high score from your previous games are displayed at the top of the screen. The level of difficulty is shown in the Jower-left comer of the screen. An undocumented use of the PLAY command has been used to produce the worm's voice (see lines $400-440$ ). Note that as the worm grows, its voice gets deeper and more robust. You may pause the game by pressing SHIFT-@.

This seemingly simple game actually requires some fairly sophisticated strategy since the path taken to the next bite of food determines the pattern of later obstacles. For really high scores, you must learn to make two consecutive right or left turns that cause the worm to double back.

While it's theoretically possible to fill the entire screen with the worm's body, to increase speed I have not included code to actually test for this condition. If you somehow achieve this state (length of the worm $=390$ ) the program goes into an infinite loop at Line 110 since there will be no unused space to place the next bite of food. Consider this as wirning.

# Legends of the C 

by Dale L.Puckett<br>Contributing Edifor

Long winter evenings provide an opportunity to dig into another programming language. So let's take another look at the C compiler package originally sold to run under os-9 Level L. Perhaps you can be encouraged to take that dusty package off the shelf and break new ground. We'll start by setting up the system.

The disks shipped with Microware C for the Color Computer are very full. In fact there are only 109 free sectors remaining on the C Compiler disk and 199 on the C Library disk. This presented problems when the package was released in 1985 and most os-9 users struggled with 35 -track, singlesided disks. Now with the availability of many hard disk and RAM disk systems and the added versatility of os. 9 Level it running on a 512 KCoCo 3 , most people find C much easier to tackle today than it was just five shor years ago.

If you are still struggling with an older disk system, here's a tip that may help you. It is sometimes easier to create several system disks; one for writing and testing assembly language programs, one for BASICAO programs and another for C language programming sessions.

There are two ways to make multiple system disks. You can use cobbler or os9gen to put the os9boot file on each of your system disks. If youdo this you will be able to boot $05-9$ with the disk containing the programs you need for the particular task at hand.

Dale L. Puckett, a freelance writer and programmer, serves as director-at-large of the os 9 Users Group and is a member of the Computer Press Association. His username on Delphi is DALEP: on packet-radio, KOHYD @ N4QQ: on GEnic, DPUCKETT2: and on CIS, 7146,736.

If you would rather not invest the time to create a new os9boot file on half a dozen disks and use dsave to move the required programs to each CMOS directory, simply maintain one system disk and a number of system programming disks. When you take this route, you will need to boot 0s-9 with your single system disk and then swap disks to insert the system programming disk with the programs you need for the language you plan to use.

Don't skip this step: After inserting the system programming disk use the chax command to make the CMDS directory on that disk your current execution directory. In other words after you remove your boot disk and insert your C programming disk you must enter the following:

$$
\mathrm{ch} \times 100 / \mathrm{cmss}
$$

This command tells os. 9 where to look for the utilities and programs you will be running. We're assuming you have used the makdir command to create the CMOS directory on your C programming disk. You will need to create a CMOS directory on all system programming disks. After you create the CMDS directories, store the required executable object code files (the commands) in each new directory. Each CMDS directory will be different. For example, you'll need a different set of utility programs for word processing or BASICO9 programming than for C programming.

Since the CMDS directory on the C Compiler disk from Radio Shack uses ail but 109 sectors on the disk, use a backup copy of this disk as your programming disk C. You can use those 109 sectors to store a few additional tools to make programming easier. For example, you'll need to copy your favorite editor into the CMDS directory on this disk. You may also find a few compare and word-search utilities such as comm, diff and grep useful.

You can use the copy command to move a few utilities into your new CMDS directory. If you're copying a number of utilities into this directory, the asave utility will be easier.

Don't forget the golden rule of computer operation: Do not make these changes on your original C Compiler disk from Radio Shack. Instead, immediately put a write protect tab on that valuable disk. Then make a copy of it using backup. Put your original C Compiler disk away to make a new copy should something happen to your working disk.

So far we have taken care of the C programming disk you will use in $/ \mathrm{do}$. Now, we'll look at the disk needed for Drive 1. It's a fact of life that to program in C using Color Computer OS-9, two disk drives are needed. For large programs, three drives are needed if you use the singlesided, 35 -track drives first released for the Color Computer. But if you use 40 - or 80 track, double-sided disk drives, two drives are sufficient.

When you purchased Microware's C Compiler from Radio Shack you received two disks. The second disk is called the C Library. It contains three directories; DEFS, LIBS and SOURCES. The C Compilerexpects to find the DEFS and LIBS directories on a disk mounted in / d 1 . If they are not found there, the compiler will not work.

The paths to the DEFS and LIBS directonies are hard coded in the C compiler to point to /d1. If you own a hard drive, or even a double-sided drive, you will want to patch your compiler so it looks for these directories on the default drive (/dd).

The DEFS directory contains a file called OS9defs.a, which stores the definitions needed by c.asm, the relocatable macro assembler included in the C Compiler package.

Take a took at any of the assembly language source files in the SOURCES direc-
tory. They are the ones with the a extension. You'll find most of them contain the line:
USE ...../defs/os9defs.a

Essentially this tells the assembler to insert the source code stored in a file named os9defs. a, located in a directory named DEFS. Again, the assumption is that the DEFS directory is on the same drive as the sources directory, /d1. When the assembler reads this file, it leams the symbolic names of the many OS-9 function calls and variables.

On closer examination of the DEFS directory on the C Library disk you'll find a number of files with an .hextension. These are C header files. Header files usually contain collections of \#define statements ordeclarations and are read by the compiler when you use an \#nclude statement in your program. With \#nclude statements in your large programs you can guarantee that all the source files will use the same definitions and variable declarations. Remember that if you change a header file you must reconstruct all files that use it.

For example, if you need the definitions that deal withos-9 signals you must include this line in your program source code.
Hinclude 〈signal.h〉

The left and right angle brackets tell the C compiler to look for a file named si gna 1.h in the DEFS directory. If you have stored header files in other directories you can tell os- 9 where they are located by including a complete pathlist to the file enclosed in double quotes. For example:

## *include -/dd/ALTDEFS/signal. $\mathrm{ha}^{\prime \prime}$

Since the std 10 , h file will be needed with almost every C program you write, you'll need the DEFS directory on the disk in /d1, unless you've modified your compiler to use the defaut drive $/ \mathrm{dd}$. As your C programming career begins, you probably won't use the other files in the DEFS directory very often. But, leave them intact. You'll need them when you compile programs from other sources such as the os- 9 Users Group Software Library or RaINBOW ON DISK.

The LIS directory contains a file named c115. 1, which stores the standard library functions, math functions and other object code needed by the system. Another file in that directory is named cstart. $r$ and contains code needed in all compiled programs. It must be in the LIB directory and that directory must be in a disk mounted in

Drive /dI, or /dd if you've modified the compiler.

The SOURCES directory holds the source code for three useful sample programs and a directory named SYS that holds the assembly language source code used to generate portions of the object code in the cllb. 1

file. Studying these files will help you understand how the C Compiler works.

If you are working with the Radio Shack 35 -track, single-sided drives, you should delete the SYS directory from the SOURCES directory tocreate more space for your own source code. You can also delete the sample C source code. Just remember to delete these files from your backup copy of the C library disk and not the original disk from Radio Shack. There were 199 free sectors available on the C Library disk before you deleted the SYS directory, so you should have plenty of room.

While learning this new language don't forget the basics. Remember, the C compiler will look for your source code and data files in your current data directory. The SOURCES directory would be a good starting place. Don't forget to use the chd command before you start compiling your C programs. To do this, type:

## chd /d1/sources

Now that you have set up your two disks (the C Compiler for Drive $/ d 0$ and the C Library for Drive /d1) you are ready to begin programming. Use your favorite editer to create a file containing a short program. For example you could use this model from page six of Kernighan and Ritchie's The C Programming Language.

```
main()
I
    printff"hello. world\n"):
}
```

After you type this short program, save it in a File named he $110 . c$. You're almost ready tocompite your first C program. First make sure your C Compiler disk is in $/ 80$ and your current execution directory is $/ \mathrm{d} 0 /$ CMDS. Also, make sure your C Library disk is in /d1 and your current data directory is /dI/SOURCES. Then, enter the command:

```
ccl hello.c
```

When you press ENTER, your disk drives will begin to spin and after several minutes you'll see something like this on your screen:

$$
\begin{aligned}
& \text { hello.c* } \\
& \text { c.prep: } \\
& \text { c.pass1: } \\
& \text { c.pass2: } \\
& \text { c.opt: } \\
& \text { c.asm: } \\
& \text { c.lfnk: }
\end{aligned}
$$

The name of the source file you are compiling is hello.c. The other lines tell which part of the C Compiler is running. You'll notice that / do starts spinning each time a new line appears on the screen. It is loading the next program into memory.

Look in your current data directory after you compile the above program to see a file named c.com. List it to leam why the above messages appeared on your screen. You'll also see what OS-9 did throughout the compiling process. Let's look:

```
echo 'hello.c*
-x
echo c.prep:
C. PREP hello.c >ctmp.4.m
x
echo c.pass1:
C.PASS1 ctmp.4.m -omctmp.4.1
del ctmp.4.m
echo c.pass2:
C.PASS2 ctmp.4.1 -o-ctmp.4.a
del ctmp.4.1
echo c.opt:
C.OPT ctmp.4.a ctmp.4.0
del ctmp.4.a
echo c.asm:
C.ASM ctmp.4.0. -0-ctmp.4.r
del ctmp.4.0
echo c.l1nk:
C.LINK/dl/lib/cstart.r ctmp.4.r
-o-hello -l-/d1/lib/clib.l
del ctmp.r
```

Let's study this listing. c.com is an os.9 procedure file generated by ect. It puts the various parts of the C compiler through its paces.

The first line in this procedure file tells

OS.9 to echo the name of the file being compiled. It then sends the built-in Shell command, $-x$. This tellis the Shell not to abort the process if an error occurs.

After sending this signal the procedure file echoes c.prep: on your screen letting you know the name of the program it plans to run next. It then sends the command to run c.prep. The same line tells c.prep to get its input from the file named hello. c in your current data directory and to put its output into an intermediate file named ctmp. 4.m.

When c.prep completes its job, the procedure file sends an $\times$ command to the Shell. This tells the Shell to abort if there is an error. It then echoes c , pass 1: and proceeds to run that program.

Notice that c.pass1 gets its input from the file named ctmp . 4 .m that was just created by c.prep. c.pass 1 sends its output to a file named ctmp.4.1.

As you study the rest of the c.com procedure file a pattern will become obvious. OS-9 is using a series of temporary files to store intermediate results. The output of one part of the compiler is putinto a temporary file used as the input for the next part of the compiler. After the temporary files have been used, they are deleted.

```
#nclude <time.n>
struct sgtbuf buf;
/* Your "main ()" program goes nere */
getime(sbuf):
printf("802d/802d/%02d $02d:802d:%02d\n",buF.t_month, buf.t_d
ay, buf,t_year, buf,t_hour, buf,t_minute, buf,\mp@code{second):}
```

Figure 1: Clock Program

These temporary files act like a pipe. The difference is the compiler is so large that it won't all fit in memory at once. The temporary files are needed to hold the results from one part of the compiler while the next part is loaded into memory. This was the only way to make the compiler work on the older Level I systems.

Work your way through the procedure file one line at a time until you understand what happens during each part of the compilation. Notice that several compiler parts can be used as stand-alone programs. For example you can use the relocatable macro assembler ( $c, a s m$ ) to create an assembly language source file that you have
written. When you write in the C language the compiler writes an assembly-language source-code file for you.

When you get to the command for c. 7 ink, the linker program, it will be obvious why you must have a directory named LIB on a disk mounted in / d 1 . The linker reads two files from this directory, estart.r and clib. 1 .

We haven't jumped into the mystery of C programming in this short tutorial, but hopefully we have helped you understand how to set up your Color Computer OS. 9 system to effectively use the Microware C compiler.

Here's something for more experienced

C programmers. Often you want to print the time somewhere in your programs. The code in Figure I should do the job.

When your program runs this code it should print the time in the standard mm / $\mathrm{dd} / \mathrm{yy}$ hh:mm:ss format. The \% 02 d 's in the code above tell printf you want the information printed in decimal. You always want it printed as two digits with a leading zero as a pad if necessary. In other words New Year's Day will come out as 01/01/91. not $1 / 1 / 91$.

One more note about C. Many people say they don't like C because the code it generates is too long. Before you jump to this conclusion, consider this: You can't really compare the size of a finished C program to a BASIC09 program unless you play fairly and count the size of BASICO9's runb module.

Remember that runb must be in memory if you are going to run your packed BASIC09 programs directly from your execution directory. When this factor is added you realize that C programs are really shonter than BASIC09 pmograms since the standardC library stored in clib.l is shorter than runb.

If you're fortunate enough to own a 512 K CoCo 3 running os-9 Level in, you can really speed up the C compiler by making a quick patch to the Cel file and pretoading the modules used by the C compiler. In the $\operatorname{col}$ file the string / d 1 is located at an offset of SOEEA from the beginning of the module. In hexadecimal this string reads 2 Fos31, Using modpateh or debug, change the 31 to 64 and save a new copy of ccl . This forces the linker to look for the LIB directory on Drive / dd (yourhard drive orhigh-capacity floppy).

To preload the compiler, use bulld to create the following procedure file:

```
load cel
load c.prep
load c.pass1
load c.pass2
load c.opt
load c.asm
load c.l1nk
```

With 512 K you should be able to load most, if not all, the C compiler modules into memory. This step, along with the patch above, will cut your compiling time to less than a minute. You can speed compilation even further by putting your source code in a RAM disk and changing your current data directory to the ram disk. This will cause the compiler to write its temporary files to the RAM disk.

## Disto Delivers a Megabyte of Memory

Once again Tony DiStefano has teamed up with Chris and Joanne Rochon at CRC to deliver another landmark OS-9 solution. Thanks to Tony's genius and Kevin Darling's programming prowess, you can now equip your CoCo 3 with one megabyte of memory. The Disto kit adds to the page switching capability in your CoCos GIME so that it can access the entire megabyte of memory. I recently installed the kit and was astounded with my first free memory report. After loading DynaStar and BASIC09 and several sets of utilities, I entered mf ree. The program reported $86 a k$ of available memory.

Installation in my CoCo 3 was particularly easy since I had previously installed the 6809 microprocessor in a socket. Disto's kit adds two small intemal boards to your CoCo. The first has 512 K and is equipped with sockets that let you plug the original 512 K on top of it. The second board holds the page switching circuit that lets the GIME recognize the extra memory. This second board must be soldered to all 40 pins of the 6809.

Operation of the CoCo 3 with a full megabyte of memory is a whole new experience. You can almost preload every os.9 program you own into memory and have it available within a split second. It's also a real gift for C programmers since it lets them preload all of the $C$ compiler Inodules in memory with enough space left over to create a small RAM disk to store and read the many temporary files created by the compiler. These two steps can cut your compile time to a fourth of its original.

For a detailed technical review of the Disto One Megabyte add-on kit, see the excellent review by Greg Law in the August 1990 issue of the rainbow.

## A Multi-Vue Word Processing Sbell

Zack Sessions is a CoCo developer who has jumped on the Multi-Vue bandwagon. Zack can be contacted through Colorsystems, Box 540, Castle Hayne, NC 28429. WPShell is a word processing-oriented graphics Shell that delivers a point and click interface with pull-down menus to do your word processing chores. It is similar in appearance to Multi-Yue's gshell and MVCanvas from HyperTech. Essentially it brings all major word processing tasks together under one Shell. You supply yoar favorite text editor, text formatter and spelling checker programs. WPShell integrates them into one package. WPShell is a bargain at $\$ 22$. It requires the wind int module from your Radio Shack Multi-Vue disk.

With wPshell, you can combine an ex-
isting public domain text editor, text formatter, spelling checker and a more utility to build a full powered word processing system. It also makes these tools available with a click or two of your mouse button. It was written in 6809 assembly language using the RMA assembler. The more utility is a staple from the UNIX world that displays the contents of a file to the standard output path one screen at atime. It then waits for funher instruction from you on whether to display the next screen, back up or skip forward. Sessions recommends Pete Lyall's excellent os-9 port of the UNIX standard.
wPShell is easily installed. Simply copy the program to the / $\mathrm{dd} /$ CMDS directory and copy the wpenv, file to your/dd/SYS directory. Once these files have been copied, edit the environment file (wpenv,file) to match your system.

## Free Ham/os-9 bes Online

The Thermal Fusion BBS in Greenville, sC, is now online and available. It is dedicated to all owners of CoCo 2 s and 3 s and is of special interest to amateur radio operators as well as os-9 users. To connect, call 803-862-7544 at any speed between 300 and 9600 bps. Use eight hits with no parity and one stop bit.

Unlimited shareware uploads and downloads are pernitted. You 'll find many OS-9 programs and many BASIC games and utilities. Amateur radio operators will find radioteletype and slow-scan television software as well as satellite-tracking programs. Of special interest to hams is the wisw CoCo Packet Radio Bulletin Board, Version 4.02 . Monty W. Haley wrote the BBS program and nomally distributes it with his CoCo Packer Radio Terminal program (COCOPACT). Although COCOPACT is not an OS.9 program, you can buy it directly from Haley at Route 1, Box 210-B, Evening Shade, AR 72532. Another amateur packet radio program is CoCoPacket, available from Brian Carling at 5131 Raywood Lane, Nashville, TN 37211. Thanks to Skip Mehlenbacher, W8HFA, for the tip.

While we're on the subject of amateur radio, thanks to James Jones of Microware for my copy of the object and source code for the public domain KA9Q TCP/P OSK network program. It's an earlier version dated from late 1986. Any amateur who needs this code as a staning point for a conversion to 05.9 for the CoCo may contact me at KOHYD@WFA. Incidentally, my IP address is [44.122.0.4].

That wraps up another year of KIssable OS-9. Have a happy holiday season and an outstanding new year. Until January, keep on hacking!

## Would You Buy a Car You Couldn't Get Fuel For? Why Buy a Computer You Can't Get Software For?

Many of you are now considering an alternative to the Color Computer to run OS/9. Are you really going to invest in an untried alternative with very limited software? Why not buy a computer that will run a UNIX Compatible (OS/9 like) operating system AND MS-DOS. According to published articles, this combination of industry-standard operating systems would run more than $90 \%$ of ALL of the software that has EVER been written. Compare the software bases represented below. We call these systems the OWL ATom. ${ }^{\text {™ }}$ Can your alternative to the CoCo be fixed locally? On-site service is available most areas on the ATom.

These highly adaptable computers we call the OWL ATom ${ }^{\text {™ }}$ series. They are not newcomers to the computer world, but are the current versions of computers which we have been building for more than 6 years. All systems can be configured with your choice of hard drive, graphics monitor, and 6 different processors. The systems described here are typical of the new versions of our line which offer 2 industry-standard operating systems.

| FEATURES | OWl ATom. | $2500 \times 1{ }^{*}$ | 1000 TL/2 ${ }^{\text {a }}$ |
| :---: | :---: | :---: | :---: |
| Processor (Speed) | 80286(12) | 80286 (10) | 80286(8) |

# The New Frontier: 

## The Most Advanced Color Computer Drive Systems Ever Offered!

## Fast No-Halt SCSI Floppies Using Optional SCSI Controller

## Proven Performance for Demanding Home or Business Users

This is the most advanced, fully assembeled CoCo hard drive system offered. Using the optional OMT1 5200 SCSI controller with our Hard Drive Interface, our new system will support no-halt floppy drives. You need not wait while typing or worry about clock time losses. Why be limited to 3 floppy drives? A complete system could now consist of $1-3$ standard CoCo floppy drives, 1-2 (or more) hard drives, and $1-3$ no-halt floppies using standard (not just CoCo) OS/9 formal. You can use
single or double-sided 40 or 80 track drives with the SCSI no-halt controller.

There are several new features with this improved interface. These include:
-Full SASI/SCSI compatible (this allows many add-ons to the versatile SCSI buss)

- No-Halt Floppies with optional SCSI controller allows full type-ahead during access
- Low factory-direct prices

$$
20 \text { or } 30 \mathrm{Meg} .40 \mathrm{Meg} . \quad 80 \mathrm{Meg} \text {. }
$$

System Prices: (Includes Hard Drive, case, \& fan, SCSI Controller*, LR/OWL Interface, Software. Fully assembled and tested.)

## \$495. \$585. \$875.

Super System Prices: (LR/OWL System as above but OMT1 5200 SCSI Controller AND 3.5" or 5.5" HD 80 Track Floppy in same case)
$\$ 595$. $\$ 695$. $\$ 1039$. 2 cases)
*SCSI controller is OMTI 5100 . Add $\$ 75$ for OMTI 5200 with FDC.

## Introducing the Quick-Link ${ }^{\text {w }}$ Interface

Provides both a 64 K Printer Buffer and Serial and Parallel Interfaces. Serial to Parallel Printer Interface ( 64 K Buffer)
\$65.
Converts serial computer output to parallel printer and also provides a $6+\mathbf{K}$ buffer in from of the printer. Serialside Female DB-25 and Parallel side is Centronics. Includes Centronics to Centronics cable and power AC-adapler. If you need an adapter from the CoCo 4 -pin serial to DB- 25 add $\$ 9$. From 300-38,400 Baud.
Parallel to Serial Interface ( $\mathbf{6 4 K}$ Buffer) $\$ 45$.
Same as above except it converts Centronics panatlel computer output to DB- 25 Femate seriat. Plug into an IBM printer coble to provide output to a serial plotiter.

- Fast Delivery from factory stock
- Optional Real Time Clock with built in battery (3-10 year lifetime)
-With the Clock you have 240 Bytes of battery backed up RAM for password protection or data storage!
- Same super stable LRTech quality

Interface Price only: $\$ 85$.
Real Time Clock-RAM: $\mathbf{\$ 2 5}$.

| Drive System Parts |  |  |
| :---: | :---: | :---: |
| Hard Drives |  |  |
| 20/30 Meg | ST/PTI | \$229. |
| 40 Meg | PTI | 315. |

## OWL WARE Software Bundle

 Disk Tutorial/Utilities/Games DISK TUTOR Ver 1.1Learn how to use your disk drive from this multi-lesson, machine language program. This tutor takes you through your lessons and corrects your mistakes for a quick, painless disk drive introduction. (This professionally written tutor is casily worth the bundle's total price.)

## 3 UTILITIES

A copy verify, copy, and DOS utility.

## 2 GAMES

We will select 2 games from our stock. These are sold for more than $\$ 20$ each. Do not mistake this software with cheap "Public Domain" software which others offer. All of this sofiware is copyrighted and professional in quality. The tutor is unique with us and has helped thousands of new users learn their disk drive.
only \$27.95 (or even better) only $\$ 6.95$ with any Disk Drive Purchase!!

## 512K Upgrade

Again at a popular price. Fully assembled and tested before shipping. Easy to install. Uses fast 120 ns . chips.

## Only \$85.

Now includes memory test, Ram Disk Lighting, Printer Lighting, and Backup Lighting. All with an upgraded manual exclusive with OWL!

Our prices include a discount for cashbut do not include shipping.
OWL.WARE hes a liberai warranty policy, During the warranty period, all defective tems will be repaired or replaced at ou option at no cost to the buyer except for shipping costs. Call our tech number for return. Return of non-defective of unauthorized retuins are subiect to a senvice charge.

Mertztown, PA 19539

# The Tour Continues 

by Fred B. Scerbo<br>Contributing Editor

#### Abstract

If you have an idea for the "Wishing Well," submit it to Fred clo the rainBow. Remember. keep your ideas specific, and don't forget this is Basic. All programs resulting from your wishes are for your use, but remain the property of the author.

Last month we introduced the graphics needed to create an educational program that reviewed the 50 states. This month those graphics are merged with a revised version of the Match Game that was introduced many months ago.

I hope by now most of you have a working copy of The 50 States from last month. You may have noticed the article was short and the program listing was very long. The data statements required were rather complex since over one hundred were needed to create the graphics maps and titles for the 50 states. And that doesn't even include the additional data statements that create the title card or those that create the string locations for positioning the graphics.

This month's listing is no exception. The data statements that create the maps and titles remain exactly the same as in last month's listing. I have even used the same line numbers for these data statements, so it is not necessary for you to retype the entire listing.

Fred Scerbo is a special needs instructor for the North Adams Public Schools in North Adams, Massachusetts. He holds a master's in education and has published some of the first software available for the Color Computer through his soffware firm, Illustrated Memory Banks.

## Getting Started

Load your working copy of The 50 States from last month into your CoCo . The lines to save are those between 1000 and 2490 . Therefore, enter DEL - 999 and DEL 2491 - to get rid of the old lines.

Next, take this month's listing and enter all the remaining lines of the program. This will save you a considerable amount of time.

You can also use these same commands to create last month's program from this month's listing. First, delete the extra lines after this month's listing has been typed and saved. Then enter the remaining lines from last month's program.

## So What's New?

Earlier in this column Imentioned this is a revised version of our original Match Game. The program originally used the PCLEAR8 and PCOPY commands to increase the speed of the graphics. However we are now using a much larger graphics array to store these so states. Match Game originally stored only 20 sets of opposites. As you can see, the number of graphics used has been more than doubled and we would very quickly run out of usable memory with these original commands. The PCLEARB command alone eats up four additional
graphics pages of usable memory. Therefore, I went through the original listing and killed any references to PCLEAR, PCOPY and any graphics page higher than four. (Thus, PHODE 4.5 would be out of the question.)

I quickly discovered my original use of the PCOPY command was unnecessary since this version seems to execute as quickly as the original. (This also means I can now make plans for largeruses of this shell since its storage capacity has more than doubled. Any ideas out there?)

## Using the Program

You get our standard title card when you run this program. Since this version does not allow you to kill part of the graphics like the earlier version, you simply press ENTER to start the game.

This game involves two players and is a standard Concentration-type game. Each player uncovers two squares at a time. Use the arrow keys to move the flashing cursor around the screen. When you reach a square you want to choose, press Enter. When a match is made, it is recognized by the computer. To let the next player take a tum, press the Spacebar. When the game is over, the scorecard will indicate the winner.

This program is a good way to review material presented in The so States. You really do not need last month's program to enjoy this one. By itself, The Match Game of 50 States can be fun for young and old alike. Let me know what you think.

## Conclusion

I think by now many of our regular readers know how flexible these various shell programs can be. If you have an idea for material that could be included in these kinds of formats, drop a wish in the "Wishing Well." You might stimulate an idea that could lead to an actual program listed in these pages.

See you next month.

For over 7 years，MusicWare has given the CoCo community some of the best music programs around．Now，we＇ve done it again with a high quality professional MIDI recorder／sequencer！
CoCo MIDI Pro，which requires a CoCo 3 with 512 K memory，will record music from any MIDI synthe－ sizer．It is the equivalent of a sophisticated 16 track recording studio in your own home that would otherwise costs thousands of dollars！．Numerous editing functions and precision performance make your job easier．Only \＄125 for program and MIDI interface！
While supplies last，Lyra，the ever popular music program that makes it easy to play，transcribe，or compose music，is only $\$ 37.00$ ．This includes a copy of the 100 page Lym Compunion． Don＇t miss Hot CoCo ，a 50 minute audio tape of great CoCo music．See the review in the October 1990 Rainbow．Only \＄9．95
MusicWare Hamlet Route Box 1261，Seaside， OR 97138．（503）738－0119．Ask for Lester Hands． Mastercard or Visa orders are welcome．

## Newspaper on

 FINAL EDITION
## DeskTop Publishing for the CoCo3?

 With Newspaper Plus - Final Edition you can create complete and sophisticated Banners, Headlines along with Text Columns and Graphics. Import different pictures, fonts, fill patterns and text from disk and create a publication with that prolook to it. Comes complete with 22 fonts, 50 NewsArt pictures and fill patterns.
## 128k or 512k Disk

$\$ 48.95$

## ShellMate

By Eric Crichlow
$\$ 24.95$
"What Multi-Vue should have been...!" NOW work OS-9 Level Two in a point ' $n$ click environment similar to the DiskMaster program on the Amiga. ShellMate is one of the FIRST commercial programs to fully use the Multi-Vue windowing system that is both friendly and powerful. Commands like COPY, DELETE, RENAME, LIST, and PRINT are at your finger tip. Additional features like creating a directory, list the contents of a standard OS-9 archive file as well as create and dearchive a file. How about viewing VEF and GIF pictures...NO PROBLEM! ShellMate is a well thought-out and useful program for OS-9. System requirements: OS-9 Level 2, Multi-Vue, Mouse or Joystick and at least 256 k system memory.
COLORING BOOK

## By John Crawford

This new Second City Software program is an electronic Coloring Book. It's so easy to use that any one who can 'point-nclick' a mouse or joystick will be able to enjoy this program. It is designed for ages 3 to 7 , however, a few of our software testers are well into middle age and have been seen spending hours using Coloring Book. Once you have colored your picture, you can save it to disk or clear the colors and start all over again selecting a completely different color palette set. Program supports Black \& White hardcopies to a Star NX-1000 dot matrix printer. COLORING BOOK:
$\$ 22.95$

MORSE CW TUTORIAL: WORD SEARCH GENERATOR: SPACE RAIDERS: STARPIC UTILITY: DMP-PIC UTILTY: GEM-PIC UTILITY:
$\$ 19.95$ $\$ 19.95$ \$16.95 $\$ 19.95$ $\$ 19.95$ $\$ 19.95$ print PMODE pictures on your Dot Matrix Printer. Works in a Point 'N Click pull down menu environment. Loads in ANY ${ }^{1 / M A X}$ " extension picture file. Select different PMODE screens and even 'INVERT your picture! This is a full featured, easy to use picture utility.

CHECK-09MV \#2.1:
$\$ 25.95$
Finally, a programthat interacts with MultiVue for FAST and EASY check balancing. 512k DISK.

APBBS Ver: 3.01 .15
$\$ 39.95$
A powerful, high quality, and affordable BBS program by Mike Guzzi for OS-9 Level II. Unleash the power of your 512k CoCo3 with thisBBS package that comes complete with all the needed STUFF that SysOp's have been demanding. An added bonus that you get with APBBS is full support after the sale. If we at Second City Software are unable to answer your question, Mike Guzzi (the author) has put his personal phone number in the manual! What better way to show a commitment to your software purchase! APBBS requires a CoCo 3 with $512 k$, at least two double sided floppy drives (a hard drive is strongle recommended), OS-9 Level 2, and RS-232 pak. APBBS is not for everyone. It is designed and intended for the SysOp who demands performance and support...

KBCom is a flexible terminal program for OS-9 Level 2 that allows you to call and log into other computers. Some of the features include:

- VT100, VT52, ANSI, OS-9 and CRT terminal emulation
- Powerful macros - Hot-Keys
- An Alarm/Clock - Conference Mode
- Full control over all RS-232 \& Window parameters
- XON/XOFF flow control
- ASCII, XModem, YModem, YModem batch, and kermit file transfers
KBCom:
$\$ 44.95$

UIth
*What if...
all CoCo music programs were this gooo?
UltiMusE III (the Ultimate Music Editor, CoCo III) is a MIDI 'Notation Sequencer. It lets you write and edit sheet music on a $640 \times 192$ graphics screen using the mouse, play it on ANY MIDI-equipped synthesizer, and print out the score. Written by an experienced computer professional who is also a serious amateur musician and composer. Copy a favorite piece of sheet music just as it looks! Why should your music sound like a machine? UttiMusE III has a wide pitch range, from 4 octaves below Middle C to over 3 above.
NEW FEATURES INCLUDE; Part Copy, Percussion Table/Staves, MIDI Clock, Note Articulation, Note Translator, Note Joiner, FULL Point 'N Click mouse/keyboard menus! UltiMusE III is the perfect computer music program for both the professional \& beginner musician.
System requirements: $\mathrm{CoCo3}$ with at least 256k memory, OS-9 Level 2, Mouse/ Joystick, MIDI Synthesizer, a Serial to MIDI cable or a MIDI interface pak.

# Displaying Picture Files Using OS-9 Level II Graphics 

With this third article in our series we continue last month's theme by looking at two very different, albeit very effective, compression methods. Unfortunately these methods are complex and BASiC09 programs to decode them would be long and slow-running. Because of this, the second part of this article addresses some changes and itnprovements to our VEF program. The compression methods discussed are those used by CM3 and GIF formats. They are a little tough to understand, so if you have difficulty, go to the second half and find out about the improvements made to the VEF viewer.

## Non-Rle Compression

Last month several different variants of a compression method known as RunLength Encoding (RLE) were discussed. This method is so named since it com-

Tim Kientzle is currently pursuing a doctorate in mathematics at the University of California at Berkeley and has worked with the CoCo since 1982. He is best known in the CoCo world as the author of V-Term. He can be found on Delphi as TIMKIENTZLE. Or you can contact him at is Croxton Avenue, Oakland, CA 94611.

presses files by encoding sequences of a single repeated byte, or run. Due to its simplicity, variations of RLE are very common. There are, of course, other methods. CoCo Max III has an interesting and effective compression method that encodes repeated bytes occurring either horizontally or vertically. By taking advantage of vertical and horizontal repetition, it can compress many graphics files significantly better than most of the RLE variants. The CompuServe Information Service (CIS) has standardized its Graphics Interchange Format (GIF) to allow many different types of
computers to share picture files. This is done by storing detailed information about picture resolution and color mapping so that viewer programs can adapt the picture to whatever display hardware is available. GIF is also somewhat remarkable since it uses a sophisticated compression method known as Lempel-Ziv-Welch compression (LZW), so named after its three founders. LZW creates a table of common sequences of bytes and uses this table to encode the data. Since this method automatically adapts to any kind of data by generating this table from the specific data file, it is very effective at compressing many kinds of data.

## Vertical and Horizontal Compression

CM3 format does several things to simplify programming, provide good compression and to avoid lengthening files. These will be discussed without much detail. CM3 compresses each line separately. Each line of the graphics data is stored with a header byte followed by the graphics data. This helps to simplify programming since each line can be handled separately. It also helps prevent the lengthening of files. If a line would be too long compressed, it can be stored uncompressed. This means that in the worst case only one byte would be added for each graphics line. The compression uses two arrays of bits that tell how to restore each byte on the line. A compressed line starts with an array of 160 bits (20
bytes), one bit for each byte of graphics data on this line. If the corresponding bit is zero, the previous byte is duplicated. If the bit is one, a bit is checked in a second array. If that bit is zero, the byte above is duplicated. Otherwise, a byte is copied from the data stored in this line. This requires only one bit if a byte duplicates the one before it, two bits if the the byte duplicates the one above it or 10 bits if the byte doesn't satisfy either of these. As long as there are a lot of bytes that are either horizontally or vertically duplicated, this will work well. But even if there aren't the line can always be stored uncompressed. For many files this might mean lines in the middle of a picture (where there is probably more detail) might be stored uncompressed, while lines at the top and bottom would be stored compressed.

## Storing Patterns

The Lempel-Ziv-Welch compression method used by GIF is rapidly becoming an industry standard. The OS-9 archiving programs ar and pak use it, as do the MSDOS programs ARC and ZOO, the Unix compress program and others. The method was originally described by the authors in a series of articles published in professional magazines. The full details of LZW compression can get complicated, but the basic idea is simple. The ideas behind LZW compression are described first, then we'll take a look at some other features of the GIF format.

If you think about it, the only way files can be compressed is to take advantage of repeated pattems in the data. For RLE, the kind of pattern exploited is a repeated single byte. For CM3, the pattems looked for are single bytes repeated either vertically or horizontally. In the case of LZW compression, the pattems compressed are determined from the data itself. An LZW encoder keeps a table of each sequence of bytes it sees, then uses the position in that table as a code for that sequence. As a rough example, if it read $a b c d a b c$ it would first store the sequence $a b$, then the sequence $c d$. Next it would see $a b$, encode that using the code for $a b$ and then store $a b c$ in the table. Each time it sees a sequence that extends an already known sequence, that sequence is added to the table. In this way it can adapt to almost any sort of data.

The only tricky part of this is that the encoder must make sure the decoder can figure out this mess. Citing from the above example, if we put $a b$ in our table and then immediately used that code, the decoder
would not know what the code stood for. Instead, the encoder will simply not use a code that has just been added to the table. This way the decoder can build its own table of codes and be assured that whenever it sees a code in the data, that code is already in its own table of sequences.

The strong point of GIF is its compression method. This method fulfills one of the two design goals of the format, which is to reduce file size for quick transmission between systems. The other goal is to allow picture reproduction on any system. For this reason GIF is careful to store the picture size and color information in a format that is easily interpreted on a wide variety of computers.

An obvious question to ask is that if GIF has such a great compression method, then why isn't it being used by everyone? There are two reasons for its lack of universal appeal. First of all, GIF is intended to allow picture files to be moved between many different types of computers. As a result it avoids storing information that might not be useful on some machines like animation information or pattern data. There is also a trade-off in complexity. GIF is much more complex than RLE approaches. GIF requires more data memory (the encode/decode tables require at least 16 K ), more program code and more time to encode or decode a file. For many program authors this is simply not worth the benefits.

## More Level II Tips and Tricks

Let's think about ways to increase the speed of our VEF program. If you look at the VEF program, there are three major pieces of code. The first procedure reads and interprets the header. The second retrieves a line of graphics data from the file. The third procedure puts that line of graphics data on the screen. The header is read only once per picture and additional speed in this operation would not significantly effect the speed of the program. When retrieving a line of graphics data from the file, there are few ways faster than a Get of the entire line, which is used for uncompressed data. Last month a trick was shown using an OS-9 system call to get exactly one compressed packet. The reason Get can't be used to retrieve the entire packet is that the length of the packet is not known in advance. Get always reads exactly enough to fill the appropriate variable. The only part left to improve upon is the code to put a line of graphics on the screen.

You may recall in the first part of this
series I mentioned two methods of putting the data on the screen. The first method was the one used in the PutLine procedure, the GPLoad escape sequence. This sequence causes the window system to store the following data into a Get/Put buffer, which can then be put directly on the screen. (This is the Put of a graphics image on the screen and not the BASIC09 PUT command to write a variable to a file.) The problem with this method is that OS-9 transfers the data from your program to the window system one byte at a time. It would be much faster to copy the data directly into the Get/Put buffer. An example of this can be seen in

Listing 1. It uses a GetStat call to map the buffer so it can be accessed directly. This is faster than the GPLoad sequence originally used.

Don't spend a lot of time re-creating the buffer from scratch if it can be avoided. This process can be avoided with a new procedure to create and map-in the buffer, which is run near the beginning of VEF, To accommodate this, a few changes must be made to our main VEF procedure. These changes are included in the revised VEF procedure in Listing 1.

There is very little speed gained with this version since the Putline routine has
to copy the data byte-by-byte to the buffer. This process is just as slow as having the window system do it with GPLoad. To correct this have the GetLine routine put the line data directly into the buffer, which makes it unnecessary for us to copy the line data around. An example of this is in Listing 2 . Since the required changes (removing the Line variable and using a variable to hold the address of the Get/Put buffer) affect nearly every procedure, a full listing has been included. This version is almost as fast when displaying uncompressed VEF pictures as programs written completely in C or assembly language. Speeding it up for

```
512K 0S-9 Level II
```

compressed pictures would require rewriting the unSquash routine in C or assembly.

## Project Ideas

Once you understand the VEF program and the changes made to it, there are several other programs to try.

Change the final version of the VEF program to handle MGE format pictures.

If you know $C$ or assembly, rewrite the VEF program in either of these languages. At the very least, rewrite the UnSquash procedure. You might even try finding a good description of the CM3 format and writing a display program for that.

Saving a graphics screen can be done in essentially the same way. The only difference is that you use the Get 1 k operation to get a line of graphics into a buffer, map in the buffer and then output the data. You will have to work around a minor bug that prevents the GetBlk operation from working on the full width of the screen. (You'll have to get only $1 / 2$ of the line at a time.)

If you have access to information on other graphics formats, compare it to those discussed here. In particular, try to figure out how the compression method works and whether or not it would work better than any of these.

## About Your Subscription

Your copy of the rainbow is sent second class mail. You must notify us of a new address when you move. Notification should reach us no later than the 15th of the month prior to the month in which you change your address. Sorry, we cannot be responsible for sending another copy when you fail to notify us.

Your mailing label also shows an account number and the subscription expiration date. Please indicate this account number when renewing or corresponding with us. It will help us help you better and faster.

For Canadian and other non-U.S. subscribers, there may be a mailing address shown that is different from our editorial office address. Send your correspondence to our editorial offices at Falsoft, Inc., The Falsoft Building, P.O. Box 385, Prospect, KY 40059.

We've Just Converted Over 250 Macintosh Quality Pictures For The Color Computer. Each Set Includes An Excellent Graphics Editor! Pictures are CoCo-MAX II compatible.

by David P. Boynton

Very few people know much about the OS-9 FSAlarm (callcode $\$ 1 \mathrm{E}$ ) system call due to its lack of documentation by Tandy in the Technical Reference section of the Level II manual. When I first leamed to use syscall under BASIC09, I thought it would be neat to set an alarm. So I gave it the address of a time packet and had no success. I then tried using the other registers, but still had no luck. After a while I completely forgot about it. Then one day I bought Inside os9 Level II from Frank Hogg Laboratories

David P. Boynton is a sophomore at Sunnyslope High School and has worked for two years in computer maintenance at a local newspaper. In his spare time David enjoys football, wrestling and computer programming. He can be contacted at 8827 N. 35th Dr., Phoenix, AR 85051.

Figure 1: Conditions for F\$Alarm

## Clear Alarm <br> Entry conditions: <br> $\mathrm{A}=0$ <br> $B=0$

## Exit Conditions: None

## Set Audio Alarm <br> Entry Conditions: <br> $\mathrm{A}=0$ <br> $B=1$ <br> $X=$ address of the 5 -byte time packet

Get Alarm Status
Entry Conditions:
$A=0$
$B=2$
$X=$ pointer to 5 -byte buffer for packet retum
Exit Conditions:
If $A=0$ and $B=0$, then the alarm was cleared.
If $A=0$ and $B=1$, then an audio alarm is set.
If $\mathrm{A}=255$ and $\mathrm{B}=255$, the alarm has already gone off.
Otherwise, the alarm is a signal alarm, and
$\mathrm{A}=$ Proc ID and $\mathrm{B}=$ Signal

Exit Conditions: None

> Set Signal Alarm
> Entry Conditions:

Not only does Tandy produce our favorite CoCo, we think it produces the best portable and MS-DOS computers as well. We've found that when satisfied Color Computer users decide to add portability or MS-DOS to their computing habits, many stick with Tandy. For these people we publish PCM, The Premier Personal Computer Magazine for Tandy Computer Users.

Each month in PCM, you'll find information and programs for the Tandy 100, 102 and 200 portable computers. And you'll find even more coverage for Tandy's MS-DOS machines from the graphics of the 1000 to the power of the 5000 .

## PROGRAMS AND PROGRAM DISKS!

We learned from THE RAINBOW that readers want programs to type in, so each month we bring you an assortment of them: games, utilities, graphics, and home and business applications. For those who don't have time to type in listings, we offer a companion disk with all the programs from the magazine. Also included in PCM each month is the Software Shopper, an "onmail" database service from which you can order the latest shareware products from our Delphi databases for Tandy MS-DOS and PC users - even if you don't have a modem!

## TUTORIALS AND PRODUCT REVIEWS!

As if all this weren't enough, we offer regular tutorials on DeskMate, telecommunications and hardware; assembly language, BASIC and PASCAL programming tips; and in-depth reviews of the new software, peripherals and services as they are released. Add it all up and we think you'll find PCM to be the most informative and fun magazine for this market today!

YES! Please send me a one year (12 issues) subscription to PCM for only \$28.* A savings of $22 \%$ off the newsstand price.

and read the "Bugs" section of the book. This section told me more about the alarm call. I began to experiment with this call and discovered its usefulness.

The alarm call has four different functions. The call sets the alam (actually the CC3I0 module) to make a tone once per second for a duration of 15 seconds. It also sets the alarm for clock to send a process signal on time match, gets the alarm status and clears the alarm.

To tell the clock which function you want, set the $A$ and $B$ registers upon entry to the call. The entry conditions for the call are shown in Figure 1.

I have written a short BASIC09 procedure named Alarm to demonstrate the alarm's functions. This procedure was written as a command line utility and as such all input is given on the command line. It will not prompt you for anything except to clear the alarm. The command syntax is as follows:

```
alarm <Function> [Date] [Time]
[Procid] [Signal]
```

The functions are:

> 1- set audio alarm
> 2 - set signal alarm
> 3 - get alarm status
> 4 - clear alarm

The date and time must be padded with zeros for the procedure to be read properly. syscall and inkey must also be in memory or in the current execution directory. For example, if you want to set an audio alarm for August 8, 1990, at 5:30 p.m., enter:

## alarm 1 90/08/08 17:30

If you use the standard shel1 supplied by Tandy, enclose all the parameters in parenthesis and quotes as follows:
alarm("1"."90/08/08","17:30")

Since I use ShellPlus, this is done for me. You can find ShellPlus on Delphi or just about any CoCo BBS.

To get the status and clear the alarm, the only parameter is the proper function. For example, to get the status, enter alarm 3.

I hope this was informative and you will find many uses for the call. Have fun with the program. <br> \title{

## 

## 

resolution screen of the CoCo 3 . an RGB monitor works best. I've also kept television users in mind by not using the first few columns of the screen since these cannot be seen when using a Tv set.

The object of Add-on is to create as many words as possible while gaining the most points. Points are awarded for each letter in the words you create. You only get points for the word that you create. For example, if you create the worl 'mob' (see Figure 1) you will have indirectly created the words 'not', 'be' and 'farms.' You will only get points for the word 'mob.'

Also on the grid are some colored squares. The dark red squares multiply the score of the word you create by three. The orange squares multiply the score by two. The dark blue squares multiply the score for the letter that occupies that square by three and the light blue squares multiply it by two.

Words are created from the letters on the grid. To begin the game, the computer randomly selects a starting word. New words must originate from one of the words already on the grid. To start a game, players must first select their tiles. These tiles are turned over to keep you from knowing the letters you have. Next, agrid appears on the screen and the first player's tiles are displayed face up. That player should study both his letters and the words on the grid. When a word is chosen, the player enters it via the keyboard. Using the joystick/mouse, move the cursor to the square where your word should begin and click the button.

Push the arrow key to show in which direction the word should go (downward or to the right). If everything is done correctly, your word is placed on the grid.

If you make a mistake typing your word and you've already entered it, simply press CLEAR to re-enter your word. If you cannot make a word. you may pass to the next player without receiving any points. To pass your turn, click the joystick/mouse when you would normally be entering your word.

For the most parn, any instructions needed are given onscreen. The * tile is a wild card letter. It isn't worth any points, but can be good to have. To create a word with this wild card, the player must include the * within the word. For example, you might enter prin*er for the word printer.

Figure 1: Word Creation

The gameendsat player discretion. This could be when you have run out of tiles or you cannot make any more words with your current letter tiles. If you are in a multi-player game, the rule for when a game ends should be mutually agreed upon prior to play. To end the game, press BREAK.

At the beginning of this article I said "a word game plus a whole lot more." By this I mean the extensive point and click system used in this program. I designed this pro-
gram to give the player more control over what happens in the game．

When you first run the program，a blue screen appears with CMP on one side and RGB on the other．Simply point to the side for your monitor（television sets use CMP colors）and click the joystick／mouse but－ ton．These are the default colors．You may change or edit these by clicking on the Colors menu selection．To change a color， simply point to the box containing the color and hold down the joystick／mouse button． Quickly clicking the button changes the colors one at a time．Clicking the word Border changes the border color．If you make a mistake and／or want the default colors，simply click on the word CMP or the word RGB．

You can return to the main menu at any time by pressing BREAK．Doing this in the middle of a game causes your final scores to be displayed until you click the joystick／ mouse button．To retum to BASIC，simply click on the BASIC menu selection．

Have fun and enjoy！Please feel free to contact me if you have any questions or comments about this program．Click on the About Add－on menu selection．After my name and address are displayed，click the mouse／joystick button to see the values for each letter used in the program．

## SNFER BACKUP UIILIIIES

＊＊Requires minimu 64K＊4
＊Copies either standard or OS－9 disks
－Does not abort on errors；allows you to copy disks that contain bad suctors
－Errors are reported by track and sector number ＊Utilizes all your RAM． 512 K version vill make multiple copies of a disk after loading the data only once
－A must for single－drive backups： Copies 10 tracks at a time using 64 K Copies 19 tracks at a time using 128k Copies an entire 80 －track disk using 512 K ！ Less disk swaps mean a big savings in time

## SUPER BOOT

4．COCO－J ORLY H
－BOOT your DECB（RS－DOS）disks by typing DOS
＊Automatically sets printer baud rate

－Automatically sets nuaber of disk tracks／sides Supports $35,36,48,89-$ single or double
－Automatically sets drive step rate Supports ob，20， 39
＊Displays directory in two columns，up to four ＂pages＂．As many as 128 entries can be displayed without scrolling off the screen －Auto－starts file named STARTUP or select file to LOAD or LOADM using arrow keys
Each progran $\$ 15.06$（U．S．）．Both $\$ 25.08$

## Hyper－Tech Software

MVCanvas 2.0
Finally a professional full screen editor for OS－9 Level II and Mulki－Vue．MVCanvas is the only CoCo graphics editor to suppor multiple resolutions with up to 16 colors of 64 displayed in $320 \times 200$ mode with palette animation and fuil functional eliphoard．

MVCanvas also supports multigle fonts with izverse，bold underline，and proportional options．Printer support includes：Epson， Star，C．Itoh，DMP（Tandy），with color printer supported for Star NX－1000 R，Citizen GSX－140，Tandy DMP－240 amd CGP－200，Epson LQ－2550 and compatables．

ShellMate 2.2
ShellMate is the epitome of what a point and click file management system was meant to be．With ShellMate，you have access to commands such as copy，move，delete，rename，makdir and free at the touch of a button．It also gives you point and click access to the Public Domain picture display utilities VEFShow and GIFOS9，as well as the archive utility Ar．

The biggest benefit of ShellMate is that it allows you to manipulate large batches of files with one mouse click when either copying，moving，deleting or arcing．You can also easily move through simulaneously displayed Source and Destination directory trees by either double clicking on a subdirectory name，or clicking on the ＂Parent＂command．

## Huck Bucks <br> by Sharon Ling

Children love to play with money. And now they can make their own play money with Huck Bucks. The dollar bill created by this program can be altered by changing the ASCII code for the border or the center. For example to change the dollar sign in the center to an asterisk, first find the ASCII code for the asterisk. Next type PRINT ASC("**) and press ENTER. The computer will display 42 , the code for the asterisk. Then in lines 100 , 110,130 and 140 change the number 36 (found in the middle of the data line) to 42. Run the program and the middle will be starred.

To change the value of the money, lines 90,120 and 150 should be changed. The changes to $\$ 5, \$ 10, \$ 20$ and $\$ 50$ are listed below.

```
$5
90 DATA 37,32,32,53,32,32,-33,37

## Protect and highlight your important magazine collection with sturdy RAINBOW binders

YES. Please send me $\qquad$ set(s) of RAINBOW binders Take advantage of these special offers with your binder purchase:

## Distinctive, Durable RAINBOW Binders

THE RAINBOW is a vital resource to be referred to again and again. Keep your copies of THE RAINBOW safe in our quality, distinctive binders that provide complete protection.

These attractive red vinyl binders showcase your collection and ensure your RaInBows are in mint condition for future use. Each binder is richly embossed with the magazine's name in goid on the front and spine. They make a handsome addition to any room.

## Put an End to Clutter

Organize your workspace with these tasteful binders. Spend more time with your CoCo and eliminate those frustrating searches for misplaced magazines.

A set of two binders, which holds a full 12 issues of THE RAINBOW, is only $\$ 13.50$ (plus $\$ 2.50$ shipping and handling).

## Special Discounts on Past Issues

To help you complete your collection of THE RAINBow, we're offering a special discount on past issues of the magazine.

When you place an order for six or more back issues of THE RAINBOW at the same time you order binders, you are entitled to $\$ 1$ off the regular back issue price. To order, please see the "Back Issue Information" page in this issue.

## Know Where to Look

You may purchase the "Official And Compleat Index To THE RAINBOW" for $\$ 1$ when you purchase a set of binders. This comprehensive index of RAINBOW's first three years (July 1981 through July 1984) is usually priced at $\$ 2.50$.
_ Save $\$ 1$ off the single issue cover price for back issues. Minimum order of 6 magazines. Please enclose a back issue order form from a recent issue indicating magazines wanted.
___ Purchase the "Official and Compleat Index to THE RAINBOW" for \$1. (Regular price \$2.50.)
(These offers good only with the purchase of a RAINBOw binder set)

All other inquiries call (502) 228-4492.

# EPROM Programmer Handbook 

by Tony DiStefano<br>Contributing Editor

Data used to program an EPROM can be a customized DOS, a frequently used utility, or a fun game. In some cases a knowledge of ma-chine-language programming may be necessary. Whatever the data, it must be in memory before you load and execute the MPROM software. The software expects the data to start at memory location 12288 ( $\$ 3000$ ). All numbers in Hex will be preceded by a $\$$. In the case of a 2764 EPROM, the data ends at 20479 ( 54 FFF ). For a 27128 chip, the end address is 28671 ( S 6 FFF ). In the case of the 27256 , only half of the EPROM can be programmed at a time. To program a 27256 you must program both halves individually and make sure you program the right data. In both cases the data start and end locations are the same as a 27128 .

After the data is loaded into memory, load the MPROM software by typing LOADM "MPROM": EXEC. You are greeted with the title page and the option to work with a 2764, a 27128 or one of two halves of a 27256 EPROM. Choose the proper EPROM and press ENTER. If the wrong EPROM is inserted into the socket, you will not damage the EPROM or the adapter, but it will not properly program or verify.

The next screen to appear is the Main menu. Following is a detailed description of each item in this menu.

1. EPROM ERASEO? - verifies the EPROM is completely erased. Initially and after each

Tony DiStefano is a well-known early specialist in computer hardware projects. He lives in Laval Ouest, Quebec. Tony' susername on Delphi is DISTO.
crasure, all bits of the EPROM are in the logic 1 (High) state. The status line starts by printing

## CHECKING FOR FF's

If all bits are erased the status line will indicate OK! at the end. If a location is not properly erased, the status line appears as

```
AT XXXX EXPECTED FF FOUND YY
```

$X X X X$ is the EPROM address (starting from 0 ), FF is the expected data (in this case it is all ones or 255, SFF) and $\gamma Y$ is the actual data found. If more than one address is not completely erased, the last non-erased address appears on the status line. When checking an EPROM to make sure it is erased, the OK must appear on the status line. If just one bit is missing, the EPROM is not fully erased and cannot be properly programmed. To erase a used EPROM, use ultraviolet light. Refer to the EPROM eraser's manual for more details.
2. PROGRAM EPROM - stants the programming process. This transfers the data in memory to the EPROM. Before starting this process, make sure the properly erased EPROM is placed in the socket. Pin 1 of the EPROM goes to Pin 1 of the socket. Pin 1 of the socket is in the lower right corner when sitting in front of the keyboard with the MPROM and controller plugged into the computer. Make sure the battery pack is properly connected before starting. The process starts by displaying the following message on the status line

## PROGRAMMING ADDRESS: XXXX YY

$X X X X$ is the current EPROM address being
programmed and $Y Y$ is the program pulse width. Let me explain. In the good old days it was believed that each location of an EPROM had to be programmed for about 50 ms , or about $1 / 20$ of a second. It doesn't sound like a lot of time, but when you have a 16 K EPROM, it takes over 14 minutes. Today's EPROMs do not have to be programmed so long. Initially, a 1 ms program pulse is sent to the address being programmed. If it proves to be enough and the data is correct, a 4 ms insurance pulse is given. If the verification shows invalid data, additional Ims pulses are sent until the data is correct or the system has sent a maximum of 15 pulses. Then an insurance pulse four times greater than the number of pulses sent is given and the value of YY is changed to reflect the new pulse width. If the EPROM data is still not valid, the program gives up and issues a status line of

```
EPROM NOT PROGAMMEO PROPERLY
AT ADORESS: XXXX
```

$X X X X$ is the address where the EPROM failed. At this point, re-program the EPROM. If it fails at the same address, there is a problem with the EPROM and it should not be used. If it fails at the next address, the batteries may be weak and need replacing. Caution: Never plug or unplug the battery pack with an EPROM in the socket. Always remove the EPROM first. When all the addresses of the EPROM are properly programmed, OK! is printed on the status line.
3. VERIFY EPROM - Even though EPROMS are verified during the programming stage, it is sometimes necessary to verify an EPROM without programming it, such as when comparing two EPROMs. The EPROM is verified by comparing the data found in the

EPROM to that in memory. The status line reads

## VERIFYING EPROM

If no difference is found, OK! is displayed on the status line. If a difference is found the status line changes to

## AT XXXX EXPECTED YY FOUND $Z Z$

$X X X X X$ is the address where the discrepancy was found, $r Y$ is the data it expected to find and $Z Z$ is the actual data found. If more discrepancies are found, only the last one is shown on the screen.
4. READ EPROM - It is sometimes necessary to transfer data from one EPROM to another or from an EPROM to disk. In either case data must first be transferred from EPROM to memory. This option transfers the contents of the EPROM into memory. The data resides in memory starting from 12288 ( $\$ 3000$ ) and is either 8 K or 16 K for a 2764 and 27128 respectively. Either half of a 27256 is 16 K . The status line displays

MOVING EPROK TO MEMORY
and OK! is printed when the move is finished. No verification is done when reading the EPROM. Verify the EPROM after a move with Option 3.
5. RETURN TO BASIC - When all EPROM activity is completed, this option returns you to BASIC. The MPROM software is still intact and you can return to it by entering EXEC (as long as you have not changed the execute address). The EPROM data is also intact. It is still in memory and unchanged. Now is the time to save the EPROM data to disk. For a 2674 the proper format for saving data is

## SAVEM "filename". siH3000,8H4FFF, \& HA027

filename is the standard filename, extention and drive number. The next three values are the start, end and execute addresses. The execute address has been chosen so that a warm start to BASIC will not crash into unwanted data. To save a 27128 or either half of a 27256 EPROM data, change the end address value from \& H 4 FFF to \&H6FFF,
6. EXAMINE/CHANGE MEMORY - used to change or verify existing data already loaded into memory. The status line prompts you for a start address. The address must be entered in Hex values only. When you are finished, press enter. The next line displayed shows the address requested and the contents of that memory location. You have three choices. The first choice is to use the up or down arrows to increase or decrease the address value by one. You can also enter a two digit Hex value that will automatically replace the old value. Or simply press ENTER and retum to the Main menu.

## Hints \& Tips

A. Use these steps to make a copy of a DOS already in the controller on a CoCo 1 or 2 .

1) Use the DOS command (or pokes) to switch to the desired DOS (DISTO Super Controller I only). Insure that the logo of the Dos you want copied is on the screen.
2) Save the DOS on disk:

For an 8K DOS, enter
SAVEM "filename". \&HCOOO.\&HDFFF. \& HA027

For a 16 K DOS, enter SAVEM "filename". \& HCOOO.8HFEFF. \& HA027
3) With the MPROM adapter properly plugged in, reload the DOS with an offset:

LOADH "filename". 8 H7000
4) Load and execute the MPROM software. The offset used in Step 3 automatically puts that DOS at address 12288 ( $\$ 3000$ ).
5) Select the 2764 EPROM for an 8 K DOS or the 27128 EPROM for a 16 K DOS.
6) Insert the proper EPROM into the ZIF socket.
7) Insure the EPROM is blank by choosing Option 1 on the Main menu.
8) Program the EPROM with Option 2.
9) Verify that the EPROM is properly programmed by selecting Option 3 .
10) Remove the EPROM from the ZIF socket. Tum the computer off and insent the EPROM into your Disto controller.

To bum EPROMs with disk-loaded DOSs, such as ADOS, follow the instructions supplied with the DOS on how to prepare it for

EPROM. Then follow steps 2 through 10 above.

Bumning a new dos with a $\operatorname{CoCo} 3$ is somewhat different. The dos does not operate from ROM as with the CoCo 1 and CoCo 2 . Instead, the CoCo 3 software reads the DOS into RAM, then modifies and adds to it. You cannot use the above steps. You must remove the DOS from the controller. temporarily replace it with another DOS and read the DOS in the EPROM programmer.
B. Some of the more experienced hardware buffs may want to fit a 2764 into a 24 -pin socket. The following is a step-by-step procedure to do this. Soldering experience is required.

1) Move the two jumpers on the solder side of the MPROM board to cover the center pin and the other pin. This swaps A11 and A12 for the 24 -pin socket.
2) Program the 2764 as usual.
3) Bend Pin 20 on the EPROM so it points up. Solder a short piece of wire from this pin to Pin 22.
4) Solder pins 1, 26, 27 and 28 together.
5) Solder a piece of wire to $\operatorname{Pin} 2$ of the EPROM. Insert the other side of this wire into the socket hole left by Pin 20.
6) Inset the 2764 into the 24 -pin socket. Pin 3 of the 2764 must go into Pin 1 of the socket, Pin 4 of the 2764 into Pin 2 of the socket, and so on.

## BED

Binary Editor for Disk*
BED will get rid of 99 percent of your disk problems. It will read any sector and display it, edit it and write it back on the disk.

It will also search the disk for bad sectors and it will hardcopy.

Send $\$ 13.95$ plus $\$ 2.95$ shipping and handling to: Soft \& Friendly 129 Prairie Virden, IL 62690

# Contest Results 

by William Barden, Jr. Contributing Editor

Back in the July issue I listed eight problems for CoCo solutions, a request to beef up the speed of one of my answers and a reader challenge to solve a second puzzle for big bucks (SM $50,000,000-$ 50 million MicroDollars). Reader response was excellent with Keiran Kenny of Cremorne, NSW, Australia, winning the special long distance award. I'm always amazed by the programming proficiency and knowledge of CoCo users. I usually wind up leaming more from readers' letters than I provide in the column. Here are the exciting results of that challenge plus an extra bonus - a program to display playing cards on the screen.

## Sum of Digits Puzzle

The original puzzle asked in how many ways nine digits could be written in three 3digit rows so that they add up to the proper result. A typical row looks like this:

645
192
837

There are $9 * 8 * 7 * 6 * 5 * 4 * 3 * 2 * 1$ or 9 ! (readas nine factorial) configurations to check in this problem, a total of 362,880 . As several readers pointed out, my programmed solu-

Bill Barden has written 35 books and hundreds of magazine articles about small computers. His newest Color Computer project, Connecting the CoCo to the Real World, is a book of CoCo interfacing projects. He has over 20 years experience in the industry on systems ranging from mainframes to micros.
tion to the problem was wrong. As Paul H. Johnson, a faithful reader and computerpuzzle buff from San Francisco, put it: "I

hate to mention it, but I believe your Line 215 is a bit flawed in that it does not recognize the possibility of a "carry"." My program does not check for such units digits as $7+6=(1) 3$. This error eliminated about half of the possible answers. Paul used a higbspeed poke with a string in his version.

Robent Gault of Grosse Point Woods, MI, did quite a bit of work on both a recursive BASIC09 program to compute the answers (about four hours from my 20 hours) and. even more impressive, an assembly language version, which computes all 336 solutions in just over six minutes!

Walter D, Pullen of Kent, wA, found an
elegant solution. He used an array instead of nine separate variables. Walter immediately checked the units and tens digits to see if their sums equaled the answer digits. If not, he went directly to the next increment. He also noted that "if S1+S2+S3 is correct, then so is $\mathrm{S} 2+\mathrm{S} 1=\mathrm{S} 3$."

James Jones of Clive, Iowa, was another reader who did a great deal of work on a high-speed solution to this puzzle. His BASIC09 version computes the answers in 32 seconds on his CoCo 3. James (who by his comments revealed that he is either a bright computer science student or a professor) used a clever trick. He looped through only the addend digits and not the answer digits. This makes the number of iterations in the loop $9^{6}=531,441$ instead of $9^{9}=387,420,489$, only $1 / 729$ of the total. This is possible because with any two addend digits, the answer digit is fixed. Another observation he had was that the sum of the two 100s digits and any carry from below must be less than or equal to nine. This saves additional iterations. The third observation he made was the same as Walter's above. I have to give James the Son of Perplexing Puzzles *8 Award for his work. His OS-9 solution is shown in Listing 1.

## Reader Challenge

Unfortunately, I was not very specific about the rules in my challenge to arrange the Ace, King, Queen and Jack of each suit ( 16 cards) in a four-by-four matrix so that no value or suit appears more than once in any row, column or major diagonal. Readers didn't know whether I wanted OS-9, BASIC, a physically short program, a fast program, or embellished program solutions. Again, it was James Jones who came through with the fastest overall version without manual calculations. In James' words, his os 9 program "scems to chug out one solution per second."

One of the best non-OS-9 solutions came
from Walter D. Pullen. It's shown in Listing 2. Walter writes, "my solution to the main card puzzle finds and displays the first solution in eight minutes. The second solution is found six minutes later, and thereafter a different solution is found every few minutes. There are 1152 total solutions to this puzzle, all of which happen to be geometrically similar to your example solution except that the board is rotated or the suits are switched. All possible solutions will be found in about three days. Note that there are potentially 16 factorial board solutions that must be checked to find them. If your sum of digits program checked 9! positions and ran in 20 hours, then a similar method employed here would take $16!/ 9!* 20$ hours or 132 centuries! To get a workable solution, we must use a little insight. Note that if the Jack of Clubs ( $\mathrm{J}-\mathrm{C}$ ) is in the upper-left comer and the Jack of Hearts (I$H$ ) is in the square next to it, then no matter where the other 14 cards are we can't have a solution because a Jack appears Iwice in the top row. This means we can avoid permutating through 14 ! ( 87 billion) boards in this case, and by applying similar checks at each position, we can reduce a complex problem with 16 ! ( 20 quadrilion) possibilities to an elegant program producing swift solutions. The program is completely general. Try reducing the value of N in Line 20 and solve the problem for a smaller board or add a new value and suit to $v s$ and $S s$ and find a solution to the five-by-five board. Whenever a board is found meeting the row and column restrictions, the message testing is printed, the diagonals are checked and if $O K$, the solution is displayed." While not nearly as fast as James' OS-9 program, Walter's is a well-crafted Extended Color BASIC version.

There were other entries that worked. Entries that found random configurations that gave one or more solutions and others in which the answers had more than one card value or suit in the same row, column or diagonal. I hope that all readers who responded will not be too offended overmy lack of rule definition. In this case, I feel a fair judgment is to declare both Jarnes Jones and Walter D. Pullen co-winners, with James winning hands down for speed. Each co-winner will receive $25,000,0006$ MicroDollars (about $\$ 25$ at current exchange rates) and, of course, adulation of Barden's Buffer readers for many years to come as
readers peruse back issues in front of a roaring fire on those cold winter nights.

## Displaying Playing Cards

As usual, I attempted to do grandiose things with limited graphics for this column. My original intention was to provide nice graphics for the King, Queen and Jack in addition to displaying all of the cards with numeric values. But even the CoCo 3 , 640-by-192 graphics mode is not quite good enough for those face cards, although a reader might prove me wrong. A more modest program in Listing 3 shows a Display Card subroutine that will display any card value and suit at a given point on the CoCo 3 screen. (Thanks to Rick Cooper of Liberty, KY, for the DRAW strings for the suits). Call the program for a 320 -by-192 CoCo 3 graphics screen with the following parameters:

- ZAS - " $v s^{\prime \prime}$ where $v$ is the value $-1,2$. $3,4,5,6,7,8,9, T, J, Q, K$, or $A$ and $S$ is the suit - C for Clubs, H for Hearts, S for Spades or D for Diamonds. To specify the Ace of Hearts, for example, ZAs-"AH".
- $Z X, Z Y=$ screen coordinates for the topleft comer of the card in $x, y$ format. To draw the card so that the top-left comer is in the sereen center set $Z X-160$ and $Z Y-96$.

The cards are 50 pixels high by 60 pixels wide, allowing you to put five cards per row in three rows on the screen at one time. The actual subroutine assumes that the DRAW strings defining both the values and suits have been defined somewhere in your own program, in addition to a 13 -element string array $\mathrm{v} \$$. One interesting feature of the program is that it inverts the value on the card bottom. You will see an upside down 10 , for example, if you specify ZAs="TC". The suit is drawn upright in the center of the card.

This subroutine may come in handy for simulating poker or other card games, providing a lot more useful display than simply a "J-H" type of notation.

See you next month with more CoCo topics.

# The Delphi Mailman 

by Eddie Kuns 05-9 SIG Database Manager

There has been some confusion about how to'send mail on Delphi, so I thought I would explain Mail this month. Mail allows you to send private messages (or files) to other users on Delphi. This is different from the Forums in which all messages are publicly viewable.

To enter Mail, type MAIL at the CoCo or OS-9 SIG prompt, or type MAIL MAIL at Delphi's Main menu. You can also enter Mail by typing /MAIL at almost any prompt within Delphi. Toleave the Mail area, press CTRL-Z or type EXIT at the Mail> prompt. While in Mail, Delphi's slash commands (such as /WHO) no longer work.

From Mail you can send a message to someone by entering SEND and responding to the prompts. While you type your message, remember to press ENTER after each line of text. Press CTRL-Z to send the completed message. If you change your mind while editing a message, press CTRL-C to cancel it. For example:

MAlL>send

To: gregl, rickadams
Subj: I'm back!
Hello. Just wanted to let you know that I am back from vacation. I'11 see you online later.

Eddie
${ }^{\wedge}$ Z

MAII>

Eddie Kuns is pursuing a PhD in physics at Rutgers University. He lives in Aurora, Illinois and works as a programmer and researcher at Fermilab. Eddie is database manager of the OS-9 SIG: his username is EDDIEKUNS.

Notice that the same message can be sent to several individuals - just type all the usernames, separated by commas or spaces, of those people you want to receive the message.

You can read new mail by pressing ENTER at the Mail> prompt. To find out who the messages are from and what the subjects are before reading the mail, enter DIR. Specific messages can be read by entering the number associated with that message. You can then press ENTER to see any following messages. If you receive a new message while you are in the Mail area, enter READ/NEW to read them.

When you read a message, you'll notice the sender's name looks like BOS1B::EDdIEKUNS. Most likely, the BOSIB:: part of the name is not important to you - it merely tells you which Delphi computer the sender was logged on to when they sent you the message. You don't need to include the computer name when you send mail to other users - simply specify their usernames. For the curious, BOSIB means it's machine IB at Boston, Delphi's central location.

REPLY and SEND/EDIT are two useful mail commands. Once you have read a message and want to send a reply to the author, enter REPLY. Mail automatically supplies the name of the person you are replying to and the subject of the reply. If you want to edit the message use the SEND/ EDIT or REPLY/EDIT commands. This leaves you in your selected editor (EDT or OLDIE) to edit the text of the message as you enter it. The message is sent when you exit the editor. If you want to reply to a message and include parts of the message in your reply you can enter REPLY/EXTRACT. This retums you to your selected editor with the text of the message to which you are replying.

Mail can also be used to send a file, which is convenient if you have edited a message offline or want to send a program
or file. First, upload the file (ASCII or binary) into your Workspace. To send the file, type SEND followed immediately with a space and the exact name of the file as it exists in your Workspace. It looks like this:

SEND filename.ext

## To download a mail message enter

## EXTRACT/NOHEADER filename.ext

right after you read the message. filename.ext is the name you want Delphi to use when it stores the file in your Workspace. You can then go to your Workspace and download the file.

Use caution when sending and receiving files, however. Delphi allows each user only 50 free blocks (or 25 K ) of disk space. You must pay for disk usage above that limit. Enter DIR while in your Workspace to find out how much you are using. Once you have downloaded a file from your Workspace, be sure to delete it using the DELETE command. Once you no longer need a message, delete it. Deleting a message may not immediately free its space, however. Mail waits until the total amount of deleted mail exceeds a threshold before purging it from your mail file (MAIL.MAI) in your Workspace. You may want to periodically enter the command PURGE/RECLAIM to clean out your mail file. Purging isn't enough, though. While the message text is deleted, your mail file still contains space for the directory information of the file. If you receive a lot of mail, you will want to occasionally use the COMPRESS command. This removes all unused space from your mail file. After using COMPRESS, go into your Workspace and delete the MAIL. OLD file, which is your old mail file.

Within Mail are a number of parameters you can set. Enter SHOW ALL to display your current settings. A very useful parameter is

PERSONAL_NAME. If you want your real name (or a phrase) to be attached to any mail messages you send, enter the command

## SET PERSONAL_NAME "real name"

You can find additional information about Mail's features by typing HELP. Next month I'll describe how to use folders within Mail. This is a convenient way of sorting the messages that you don't want to immediately delete.

## Database Information:

When you upload a group of files to the os-9 SIG database, please direct your sub-
mission to the right Topic area. You don't need to submit it to New Uploads. Your group is automatically placed in New Uploads for about a month and will then be moved into the appropriate database area.

Tim Kientzle released make, a useful utility for anyone writing code. This version of make was ported from UNIX. Rick Adams' patch for TISEdit allows it to run in an OS-9 Level II device window. Finally, the enhanced gfx 2 (a new version of $\mathrm{gf} \times 2$ for BASIC09) uploaded by Kevin Darling is the one Dale Puckett has been talking about for several months in "KISSable os-9."

Tetrishas finally made its way to os-9 on the Color Computer. Mike Sweet ported it
from UNIX to OS-9. Matthew Thompson posted information about the 68070 and VSC chips which make up the heart of the MM/1 and TC-70 computers.

In the CoCoSIG, Glen Dahlgren contributed utilities that allow you to play sound files created with SoundTrax, as well as a sample which is described as a rap for Kyum Gai: To be Ninja. Marty Goodman posted the first new entry into the Soapbox database area since its creation with a trip report by Phillip Brown (THEFERRET) describing a recent visit to the Soviet Union as part of the University of Califomia at Berkeley Glee Club.

## GET 'EM WHILE THEY'RE

## BACK ISSUES STILL AVAILABLE

Have you explored the wealth of information in our past issues? From our very first, four-page issue to many with more than 300 pages of material, it's all just for CoCo users - a great way to expand your library!

## A WORLD OF INFO AT A BARGAIN PRICE

All back issues sell for the single issue cover price. In addition, there is a $\$ 3.50$ charge for the first issue, plus 50 cents for each additional issue for postage and handling if sent by United Parcel Service. There is a $\$ 5$ charge for the first issue, plus a $\$ 1$ charge for each additional issue on orders sent by U.S.Mail. UPS will not deliver to a post office box or to another country.

## MOST ISSUES STILL AVAILABLE

Issues July 1981 through June 1982 are available on white paper in a reprint form. All others are in regular magazine form. VISA, MasterCard and American Express accepted. Kentucky residents please add 6 percent sales tax. In order to hold down costs, we do not bill, and no C.O.D. orders are accepted.
Due to heavy demand, we suggest you order the back issues you want now while supplies last.
To check availability and order, review and fill out the form below and mail it with your payment.
For greater convenience, order through the Rainbow Magazine Services area of our Delphi CoCo SIG.

## RAINBOW INDEX

A complete index for, July 1981 through June 1984, is printed in the July 1984 issue. Separate copies are available for $\$ 2.50$ plus 50 c handling.

Indexes for subsequent years are published annually in the July issues of THE RAINBOW.

Article Reprints
In instances where a given issue is now out of print and not availabie for purchase, we do provide photocopies of specific articles. The cost for this service is $\$ 1.50$ plus 50 cents $\mathrm{S} / \mathrm{H}$ per article. This service is provided only in the case of out-of-stock issues.

Please send me the following back issues:

Pynamix
This is a fascinating CoCo 3 game of skill and coordination. Pyxmix is 100\% machine language written exclusively to take advantage of all the power in your 128 K CoCo 3. The Colors are brilliant, the graphis sharp, the action fast. Written by Jordan Tsyetkoff and a product of
 ColorVenture. Disk: $\$ 19.95$

## The Freedom Series

 your computer into a digital voice recorder. The optional Hacker's pac lets you incorporate voices or sounds that you record into your own BASIC or ML programs. This is not a synthesizer. Sounds are digitized directly into computer memory so that voices or sound effects sound very natural. One "off-the-shelf" application for Vocal Freedom is an automatic message minder. Record a message for your family into memory. Set Vocal Freedom on automatic. When Vocal Freedom "hears" any noise in the room, it plays the prerecorded message directly from its Random Access Memory with amazing fidelity! You may also SAVE or LOAD sounds to and from DISK. VF also tests memory
to take advantage of from 64 K up to a full 512 K . Requires low cost amplifier (RS cat. *277-1008) and any microphone. Will run on a CoCo 1, 2, or 3. Vocal Freedom Disk: \$34.95. Optional Hacker's Pac Disk: $\$ 19.95$. Disk for both: $\$ 49.95$

## Mental Freedom

Would your friends be impressed if your computer could read their minds? Mental Freedom uses the techniques of Biofeedback to control video game action on the screen. Telekinesis? You control the action with your thoughts and emotrons. Your goal is to materialize and levitate objects with the power of your mind while avoiding the insidious cobra. Mental Freedom teaches peace of mind in the face of adversity. Mental Freedom even talks in a perfectly natural voice without using a speech synthesizer! Requires Radio Shack's low cost Biofeedback monitor, Cat. \#63675. Will run on a CoCo 2 or 3 but not CoCo 1. Disk: $\$ 24.95$

## Lightning Series

These three utilities give real power to your CoCo 3.

## - Aamdisk Lightning

This is the best Ramdisk available. It lets you have up to 4 mechanical disk drives and 2 Ram drives on-line and is fully compatible with our Printer Lightning. Disk: $\$ 19.95$

## Printer Lightning

Load it and forget it--except for the versatility it gives you. Never wait for your printer again! Printer runs at high speed while you continue to work at the keyboard! Disk: $\$ 19.95$

## Backup Lightning y

Reads your master disk once and then makes super fast multiple disk backups on all your drives! No need to format blank disks first! Supports 35, 40 or 80 track drives. This utility requires 512K. Disk: $\$ 19.95$

-
Produce standard grade 2 Braille on a Brother daisy wheel printer. Easy to use for sighted or blind user. No knowledge of Braille is necessary. Call for free sample. Will run on CoCo 1, 2, or 3. Disk: $\$ 69.95$

## VSOS the Undine

VDOS, The Undisk, ramdisk for the CoCo 1 or 2 only. Available only on tape: $\$ 24.95$
VDUMP, backup Undisk files to single tape file. Requires VDOS. Tape: \$14.95
VPRINT, Print Undisk directory. Requires VDOS. Tape: $\$ 9.95$

Add $\$ 2.50$ shipping/ handling in USA or CANADA
Add $\$ 5.00$ to ship to other countries

## by Andrew T. Boudreaux, Jr.

Members of my CoCo sig in New Orleans discussed at a recent meeting various ways of gathering with other CoCo owners in the city. We had already explored several unsuccessful ideas and were perplexed on how to accomplish our objective. Several new ideas, including public service announcements and advertisements on local TV stations, were suggested. My son. Brent, was in production on his own TV show and said we should consider making our own show on the Color Computer. He offered to help us with the project and explained that if ours was an educational program without direct advertising we could get the equipment and studio at no cost through the Community Access Corporation, which is local cable Channel 42 . Channel 42 provides facilities and equipment for local community-related programs.

Within two weeks all the necessary forms
A local cable-ri producer: Andrew Bourdreaux, Jr., has used the Color Computer for over three years. He lives in New Orleans with his wife and three children. He can be contacted at 20 Gibb Drive, Chalmette. LA 7004.
had been completed and we had a commitment to produce a 13 -week series called Learn Your Color Computer. The excitement of this new project sparked our members into action. Member Chris Mayeux decided to write the scripts and host the show. Others searched for $3 / 4$-inch commercial tapes, lined up technical assistance, collected special cables and connectors as well as other bits and pieces needed.

Below are several Color Computer programs created by Chris Mayeux for our show that may be of interest to you.

Every TV station requires a one minute header at the beginning of a show. HEADER (Listing 1) creates 30 seconds of color bars. a 20 second slate and a 10 second countdown. Instructions for this are included.

CREDGEN (Listing 2) produces the tities for the beginning of the show as well as the credits at the end of the tape.

TELEPRMT turns a monitor (B/w or color) or TV into a teleprompter so your host can read the script while on camera without having to memorize many pages of written material.

ASCII files (with a . TXT extension) from any word processor can be made compat-
ible with TELEPRMT with SCRIPTO. To be most effective, files must be saved in a 32 column format without words being broken apart on the monitor.

WHOSONLN allows for the use of a floor monitor during your show. This allows the host to know who is on hold for up to five phone lines. There is also a single crawl line that can send messages from the control booth to the host while on camera.

This was an enjoyable project for our group. While it was interesting to work in an actual TV studio, we discovered we could have the same results with a quiet room, our CoCo setup and one camera. This enables us to do our show on days when we can't use the studio.

We made our show by shooting part of a studio/host direct shot followed by a section read directly from the computer output. This process was repeated until we had completed a 30 minute show. We found that by continually putting the camera in Pause mode, a three man crew could do this type of filming with positive results. We finished the last three shows in this manner.

With a $1 / 2$-inch video camcorder, we shot the show with our own cable adapters and dumped the results to the commercial $3 / 4$ inch tape. When using only one camera, frequent change of camera placement will produce a multi-camera effect. There is time during the computer direct to allow for camera and tripod movement for a new angle.

A general release from Tandy Corporation should be obtained before any TV station or cable company is approached about producing this type of show. Releases for music, talent and software used on the show should also be secured. These releases are recommended for the protection of your group even if they are not requirements of the TV station.

Use the talents within your own group to produce a show. Scripts on various subjects can be written by anyone in your group. You can choose one host or, for more club involvement, a series of rotating hosts for the show. The people who work behind the scenes are very important to the overall success of the show. A project of this
magnitude requires a commitment from the entire group to be successful.

We leamed several things during the production of our show that might be helpful to you. First of all, keep both text and demonstrations simple. Whatever the subject, make sure your segments are related and can be easily connected in the viewer's mind. Repeat instructions often during a segment. Make sure demonstrations of instructions are exact and cohesive. Break subjects into as many simple sections as time permits. For a smooth show, elect one director who is responsible for the overall quality of the production.

For assistance in the production of your own show, write to the National Federation of Local Cable Programmers, P.O. Box 27290. Washigton, D.C. 20038-7290. If your community does not have cable, contact the local TV station and ask about the possiblity of airing your show.

We of the CoCo SIG in New Orleans hope your group has as much fun as ours with this project, and that the final production is met with positive results.

## Move into the '90s with LISTG SUPER PRODUCTS

Supar Comtroller II
NOW AVAILABLE AT YOUR RADIO SHACK STORE PART \# 90-2009 UNDER OS-9: Buffered read/write sector achieved without halting the CPU means no loss of time or keyboard strokes. Mini Expansion Bus for 1 Super Add-On. One DOS included.
$\$ 130$
Super Controller II

- Sockets for 4 DOSes
- Mini Expansion Bus for 1 Super Add-On.
- One DOS Included. $\$ 99$

Mind Comtroller I

- Lowest Price Anywhere!
- Sockets for 2 DOSes
- Accepts 24/28 pin DOS
- One DOS Included. $\$ 75$

## NEW! GET ग MEG

 Of memory in your COCO 3 with Disto's 1 MEG Upgrade Kit.- Requires a 512 K COCO 3 and soldering experience.
- Kit includes 512 K mem and all necessary hardware.
- OS9 Drivers, by Kevin Darling, included.

## ©NLY §999 <br> Zero K Kit \$159

## MEB II

 A carrier to plug in 1 Super Add-On. MultiPaK required. $\$ 35$RS-232 PAK
Compatable with RS Deluxe RS-232 Pak. DB-25 cable included. Multi-Pak rqd. $\$ 55$

## RGB to MONO

Monochrome video \& Audio adapter. \$35

NEW ! From Rainbow's author, Tony DiStefano:
"A Full Turn of the Screw"
The complete collection of "Tum of the Screw" articles from Jan '83 to Jul '89. \$20

## Super Add-Ons

4IN1 Multi-Board Adapter Hard Disk, Real Time Clock Serial \& Parallel Ports. Req. SC-II or MEB-II. \$130
3IN1 Mult-Board Adapter
Real Time Clock, Serial \&
Parallel Printer Ports. $\$ 75$
RTC \& Printer Interface
Rtime \& Parallel Port. $\$ 35$

## MPROM Adapter

 EPROM Programmer. $\$ 55$Hard Disk Adapter
SCSI or SASL. No Multi-Pak needed if used with SC-I or SC-II. RGB DOS and Hyper I/O supported. $\$ 40$
HDISK \& RS-232
Same as above but with RS-232 Serial Port. $\$ 70$
RS-232 Adapter
A true Serial Port. $\$ 40$

## SR-3.512K Upgrade \$90

Upgrades a COCO 3 to 512 K memory. Ramdisk, printer spooler and memory test software included! Zero K $\$ 25$

11 Boul. Des Laurentides, Laval, Quebec, Canada H7G 2S3
Include S\&H of \$4 or \$8 if order exceeds \$70 MC/Visa Accepted

# New <br> Modems 

（1）Two varsiona of SendFaxModems Send any text file and most graphics files from your computer to any Fax machine in the world．Both external and internal（for PC） models．And with full 2400 Baud data modem capability．
（2）V．42N．42bis 2400 Baud data
modems．
These have both error correction and data compression（gives much higher eflecive throughput，as much as 9600 Baud）．

All are high quality modems made by Zoom
Telephonics in the USA，with perlormance
features unmatched by competitors costing three times as much．

Fully Hayes compatible．Work with any computer．
Alt the features you expect in state of the an modems．With No year mifg warrantee（a seven year warantee is available）．

Money saving premiums for Delphi，GEnie， CompuServe，erc．

## CoCo Consultations

# GIME Ghostbusters 

by Marty Goodman<br>Contributing Editor

I'$m$ getting a ghost image on my screen. This image is present with both my RGB and composite video monitors. I replaced the GIME chip with a new one from Tandy National Parts and the image problem remains. Any ideas?

Neal Budd (NEALBUDD)
St. Petersburg, Florida
By far the most common cause for a problem like this is a defective GIME chip or one that is making poor contact with its socket. Since you have replaced the GIME chip and reseated the chip in the socket as well, perhaps your problem is more subtle. Some kind of ringing in the memory circuitry? I'd urge you to re-check the seating of that GIME chip and thoroughly inspect the contacts on the GIME chip socket for signs of corrosion.

Neal later responded: It was the GIME chip that was at fault. And apparently the one sent to me by Fort Worth was also defective. The problem was solved when I tried a third one borrowed from another computer.

How very unusual. Tandy National Parts seldom sends defective parts. I've been highly impressed with the quality of their service. However, 1 guess no one is perfect! Glad you solved the problem.

Martin H. Goodman, M.D., a physician trained in anesthesiology, is a longtime electronics tinkerer and outspoken commentator - sort of the Howard Cosell of the CoCo world. On Delphi, Marty is the SIGop of Rainbow's Co Co SIG and database manager of os 9 Online. His non-computer passions include running, mountaineering and outdoor photography. Marty lives in San Pablo, California.

GIME Extractions
I've heard you, Marty, recommend use of two jeweler's screwdrivers at diagonally opposite ends of the GIME chip as a means of removing it. I used an alternative solution. I fabricated a GIME chip extractor from an ordinary IC puller. I merely filed down the grabbing part of an ordinary IC puller (of the sort available at Radio Shack and most other electronic supply houses) so that they were $1 / s$ inch in width and nor the 1/s inch width sported by the stock puller. At this point 1 could insert the grabbing part of the IC puller at diagnonally opposite corners of the GIME chip and smoothly lift it from its socket.

Robert Capone
Reading, Pennsylvania
Thanks for the tips, guys!

## Wide-Screen Modem Pak

How can I make use of 40 or 80 columns on the screen with my Direct Connect Modem Pak? How can I transfer to disk such tape-based games as Pyramid, Raakatu or Madness and the Minotaur?

Dwane Flint (DEANE)
Leesville, Louisiana
The software in the DC Modem Pak limits it to 32 columns. If you use other software that drives the hardware of the $D C$ Modem Pak (such as Mikeyterm, Delphiterm and Vterm, all of which have provisions for talking to the modem pak) you can operate the Modem Pak and have an 80 column screen. You'll need a Multi-Pak, Slot Pak III or Y cable to connect both the DC Modem Pak and disk controller to the CoCoat the same time. The DC Modem Pak is such an ill-conceived device I strongly recommend you get rid of it and invest in any inexpensive 1200 -bps extemal modem that can be hooked to the 4-pin serial port of your Color Computer and used with

Delphiterm, Vterm and a host of other terminal programs. No Multi-Pak will then be required. You will also get faster, more efficient file transfers.

I don't have any how-to series of steps for putting those classic tape games on disk, but the usual problem with ancient tape-based games is those games load at location $\$ 600$ in memory. This conflicts with the disk buffer area in a disk-based system. Putting them on disk involves offset loading the games into memory above location \$EOO and adding a little assembly language block-move program that, upon execution, block moves the program back down to $\$ 600$ (or wherever it is normally loaded) and then transfers control to the now properly located program.

## Gaining Grounds

Where is a good site to solder a really big ground wire onto the motherboard of the CoCo? I'm putting mine in an AT-type case and want a site to connect the ground wire.

Ted Jaeger (TEDJAEGER)
Fayetteville, North Carolina
The spots where the clips that connected the motherboard to the back of the keyboard used to go are excellent locations.

## Lands for Extended ADOS

I have two older disk controllers that lacked lands 36 through 39 on their 40-pin edge connectors. This presented a problem when I wanted to use them with Extended ADOS that requires Pin 37 (the A13 line) to connect its IOK EPROM to the COCO. Some DB-25 connectors have pins that you individually crimp to wires and plug into blank DB- 25 comnectors. These pins come joined by a strip of metal. I cut thin strips from this spare metal, bent one end up slightly to facilitate later soldering and bonded them to the controller card using Super Glue in
one case, and Devcon Plastic Welder in another. After the strips were attached I used a file at the edge to make sture the edge was smooth. Both controllers now work fine with Extended $\mathrm{ADOS}-3$.
D.S. Ricketts (STEVEPDX) Portland. Oregon

## Double Sides for TW-80

Several folks have asked me about using TW-80 with double-sided drives. If you load the configure program for TW-80 you will find in it the following:

> 370 GOSUB $3890: D 2-A$
> 380 GOSUB $3890: 03-A$

Edit those statements to read instead
370 GOSUB $3890: \mathrm{D} 2-8 \mathrm{H} 41$
380 GOSUB $3890: \mathrm{D} 3-8 \mathrm{H} 42$
and then run the configure program. TW-80 will now recognize the back sides of drives

0 and 1 as drives 2 and 3. This is the usual arrangement in ADOS and most other Disk BASIC enhancements. However, the drives will still be treated as 35- (not 40.) track drives.

> Art Flexser (ARTFLEXSER) Miami

A very interesting and helpful solution!

## Long Printer Lines

How far can / run a parallel printer cable? $I$ ' ve been told that 12 fect is the limit, bur I'm in a situation where I really need to run a 25 -foot cable.

Ernest N. Dotson, Jr. (ENDOTSON) Marmet, West Virginia

In most applications parallel printer cables will work fine in lengths up to about 30 feet. Your best bet is to extend such a cable by using a 36 -wire male-to-female, 36 pin Amphenol (often incorrectly called Centronics) connector. This assures that all
data lines in the extension are separated by grounds. I've heard of people who run parallel cables 50 feet or more without problems, but that is pushing matters and success will vary with the exact circuitry used for the parallel output and input circuits that are joined by such cables. Jameco, of Belmont, California, used to sell a parallel cable conditioner specifically designed to make extra long parallel printer cables work more reliably. I believe it incorporated circuitry to buffer the data lines and/ or clean up problems with the data strobe using a Schmitt Trigger circuit. More widely available, albeit more expensive at $\$ 150$ or so, are pairs of serial-to-parallel/parallel-to-serial converters, that separate your printer from your computer by 100 feet or more by sending the data over a small cable in serial protocol at 19,200 baud or more. This last solution results in slower throughput than a straight parallel cable and could slow things down in graphics-intensive printing situations.

## Disk BASIC/MS-DOS Crossover

Can I use 35-rrack drives with your program (from the June and July 1980 issues) that provides a means of reading and writing ASCII text files from and to an MSDOS disk on the Color Computer? In that article you also gave an address for Xenosoft, a company with a product that would read and write alien disk's (including Disk BASIC disks) on an MS-DOS machine. I wrote to that address and my letter was rehurned. Are they still in business?

Charles Gable
Wayne, New Jersey
I'm afraid you must have a 40 -trackcapable drive to properly read and write MS-DOS disks since MS-DOS has always used all 40 tracks. However, if you are lucky and the file you want to read on the MS-DOS disk is located within the first 35 tracks of the disk, then my program will successfully read and transfer it to CoCo format. Similarly I believe that if you first formatted your single-sided MS-DOS disk on an MSDOS machine (FORMAT / S) and then used my MS-DOS program to write to it, it will work perfectly well as long as you don't try to cram enough files on it to fill more than the first 35 tracks. My FORMAT program that formats an MS-DOS disk on a CoCo will no
doubt fail if used with a 35 -track drive.
Xenosoft, I am happy to say, is still in business and moved to newer and bigger quarters a few months after my article was written. There were some serious problems with mail forwarding due to errors made by his local Post Office, the proprietor tells me. Xenosoft has been steadily adding support for more and more alien formats to Xenocopy, which now permits a PC compatible to read and write disks fromover 300 different types of alien computers (OS-9 is currently not supported). Their new address is 2210 Sixth St., Berkeley, CA 94710.

## Of LaserJets and Desk.Jets

We've seen HP DeskJet printers advertised for as little as $\$ 350$ and HP LaserJet printers for under $\$ 900$. Can either of these be used with the Color Computer? Should one consider getting them instead of a 24 pin dot matrix printer?

Bill Condie (DESKMAN)
Manhattan, New York

## David Francis <br> Austin. Texas

I've heard from several CoCo users who use the HP DeskJet ink-jet printer and are very pleased with it. At $\$ 350$, one should seriously consider it when compared to the more expensive ( $\$ 300$ and up) 24 -pin printers. Note that the DeskJet and laser printers take paper one sheet at a time and may not be suitable for some label and forms printing applications. Additionally, unlike impact printers, they cannot handle multiple-form copies at once. But as prices on these come down, they are becoming attractive alternatives to higherend, NLQ dot-matrix printers. The DeskJet can (with an optional cartridge) be set up to emulate Epson printers, which makes it instantly compatible with a wide range of software. I also saw the HP LaserJet II driven by the CoCobased Microworks video digitizer at one ralnbowfest a long
time ago. LaserJet printers require complex escape sequences to select fonts and no CoCo word processor programs are set up to conveniently use all of their power. But you can use a minimum of their features and fonts with most existing programs if you are patient about defining appropriate macros for embedded control characters.

## In Search of RFI

Is there a way to disable the TV output of the CoCo 3, thereby reducing RF interference when using a monitor?

James H. DeStafeno Wyoming, Delaware

You can disable the RF output by either entirely desoldering the RF modulator box or by cutting the power trace that goes to it under the PC board. I do not recommend this. I think if you do this you will discover that the RFI you seek to eliminate is still present. You see, most if not all, of the RFI from the CoCo comes from transmission from the main computer board and not from the RF modulator.

## One Cart Short

In attempting to perform the CART inter-rupt-strapping procedure that you described in one of your articles, I discovered what may be a simpler way to get the same result in the $26-3124$ (new style, smaller) MultiPak. You can get at Pin 8 of the to-pin sockets at the low ends of the four pull-up resistors (R3 through Ro). Short these together at their low ends and the strapping is accomplished without having to fake owt the main motherboard or remove the ground-plane sheet.

Jim Harrison
San Diego
That sounds excellent. Thank you for the tip.

Your technical questions are welcomed. Please address them to CoCo Consultations, Therainibow, P.o. Box 385 , Prospect, KY 40059.

We reserve the right to publish only questions of general interest and to edit for brevity and clarity. Due to the large volume of mail we receive, we are unable to answer letters individually.

Questions can also be sent to Marty through the Deiphi CoCo sig. From the CoCosIG> prompt, pick Rainbow Magazine Services. Then at the rainbow prompt, type ASK (for Ask the Experts) to arrive at the Experts> prompt, where you can select the "CoCo Consultations" online form, which has complete instructions.

## CBASIC Editor/Compller

The ULTIMATE Color Computer Basic Compilerl!!
If you want to write last machine lenguage programs but you don't want to spend the next few years trying to write them in Assembly Language , then CBASIC is the answaril! CBASIC is the only fully integrated Basic Compiler and program editing system avallable for the Color Computer. It will allow you to take full advantage of all the capabilities avalable in your color computer without having to spend years trying to learn assembly language programming. CBASIC allows you to create, edit and convert programs from a language you are already familiar with Extended Disk Color Besic, into tast efficient machine language programs easily and quickly. "The most complete Editor/Compiler Ihave seen for the CoCo.."-The RAINBOWMarch 1986
CBASIC is a powertul tool tor the Beginner as well as the Advanced Basic or M.L. programmer. CBASIC features well over 150 compiled Basic Commands and Functions that fully suppon Disk Sequential and Direct access files, Tape, Printer and Screen VO. CBASIC supports ALL the High and Low Resolution Graphics, Sound, Play and String Oporations available in Enhanced Color Basic, including Graphics H/GET, H/PUT, PLAY and H/DRAW, all wilh $99 \%$ syntax compatibiity.

Specify Coco 1, 2 of 3 Disk $\$ 149.00$

## December Specials

Window Master and Writer.... $\$ 99.00$
Adv. Pgm Guide and DA Pak... $\$ 49.00$
Font/lcon Editors \& Memory Game $\$ 19.95$
Edt/Asm III and The Source... $\$ 89.00$
CBASIC Editor/Compiler..... $\$ 125.00$

## 512K Only $\$ 99$

Give your COCO 3 all the power it deserves with this easy to install (no soldering/plug in) 100\% Tandy compatible 512 K memory upgrade. Completely assembled and tested. Includes Ramdisk \& Memory Test sottware described below. $\$ 99$ or 512 K * Window Master $\$ 149$

## CoCo 3 Turbo Charger

Turbo Charge your 512k Coco 3 with this ALL Machine Language program that will run your machine at double speed all the time even for tloppy disk access and give you 2 ULTRA High Speed Ram Disks. If's Reset protected so it won't disappear like other Ramdisk programs. You also get a 512 K memory tester program, it pertorms several bit tests as well as an address test.

Requires 512 K \& DISK $\$ 19.95$

## Window Master V3.0

The Ultimate User Friendly Point \& Click operating enviornment for your coco 3. Simple enough even for children to use, just point and click to run programs, select filles, do disk or file maintenance or almost any tesk you currently do by typing commands. You also get things like a print spooler, Programmable Function Keys, a Buffered Keyboard, Ramdisk, Serial I/O port and Deluxe Pak support along with Windows, Icons, Butions, Pull Down Menus, Edi Fields and Mouse functions all in one program. It has multiple lonts in 54 possible sizes and styles, Enhanced Basic Editing and much much more. It add over 50 commands and Functions to Basic to fully support the Point \& Click System without the need for OS9. ".It offers so many features that It isprobebity underpriced. Irecommend this softwere toall CoCo3owners." -The Rainbow Feburary 1989
it is completely compatible with existing Basic programs and takes absolutely no memory away from basic. It requires 1 Disk Drive, R.S. hires interlace \& Joystick or Mouse. Includes 128 \& 512 K versions for only $\$ 69.95$.

## Window - Ware

Window writer- A point a click Word Processor, leatures both Mouse \& Keyboard type editing, proportional printer support, powertul formatting capability, works with any printer. Compiler-similar to CBASIC only it compiles all the Window Basic Statements to create super last Machine Languago programs a Desk Accessories. $\$ 99.00$
Window Edt/Asm- A lull fealured Edilor \& Assembler for Window Master, \$49.95 Eont/leon Editors- A utilly disk with the Font \& loon Editors to create or edit your own, includes Basic \& M.L. versions $\$ 19.95$ Advenced Progremmers Guide- A guide lor Blasic a M.L. programmers on interlacing to Window Masters complete system including Syslem Calls, Memory Map, Interrupt handling \& Extended Memory Access. \$24.95 The Memory game- A point \& Click concentration game, lots of fun $\$ 19.95$
Desk_Accessory.Pek- Installs up to 7 resident D.A. programs, including: Font \& lcon Editors, Function Keys, Terminal program, Graphics Editor \& Calendar and more, $\$ 39,95$

## DataPack III Plus V1.1

## AUTOPILOT and AUTO-LOS Processor:

 X-MODEA DIRECT DISK FILE TRANSFER VT-100 s VT-52 TERMMNAL EMULATION- No loat data even at 2400 Baud on the Serial VO port, 8 Selecteble Display Formats, $32 / 40 / 64 / 80$ columns ASCII \& BINARY disk file transler via XMODEM. Direcily record recelve data (Data Logging). VT-100 emulation for VAX, UNIX and ohher systems. VT-100/52 cursor keys, position, Pf is Alt. Kbd. keys. Programmable Word Length, Patily, Slop Bits Complete Full and Hall Duplex aparation.
Send full 128 character set from Keyboard.
- Complets Editor, Insert, Delote, Change or Add.
- 9 Varisble length, Programmable Macro Key buttons.
- Programmable Printer rates from 110 to 9600 Baud.
- Send Files Irom the Butler, Macro Key Butters or Disk,
- Display on Sereon or Print the contents of the Bufler.
- Freoze Display 8 Review information On line.
- Buill in Command Manu (Help) Display.

Supporis: Modem-Pak a Deluxe Pak of Serial Port.
Speclly Coco 1, 2, 3 Disk \$49.95

## "The Source"

The SOURCE will allow you to easily and quickly Disassemble machine language programs directly Irom disk and generate beautitul, Assembler Source Code. And " The Source" has all the features and functions you are looking for in a Disassembler

- Aulomatic Label generation.
- Allows specilying FCB, FCC and FDB areas.
- Disassembles programs directly from Disk.
- Aulomatically tocates addresses.
- Output listing to the Printer, Screen or both.
- Generates Assembler source directly to disk.
- Built in Hex/ASCII dump/display.
- B Selectable Display formals $32 / 40 / 60 / 80$.
- Builh in Disk Direciory and Kill file commands.
- Menu display with single key commands.
- Written in Ultra last machine language.

Specify Coco 1,2 or 3 Disk $\$ 49.95$

## EDT/ASM III

EDT/ASM Ill is a Disk based co-resident Text Editor \& Assembler. It is designed to take advantage of the new features of the COCO 3 . It has 8 Display fomats from 32/40/64/80 columns. The disk also contains a free standing ML Debug Monitor.

EDT/ASM III has the most powertul, easy to use Text Editor available in and Editor/Assembler package for the Color Computer.

* Local and Global siring search and/or replace.
- Full Screen line editing.
- Load and Save standard ASCll formatted files.
- Block Moce \& Copy. Insert, Delete, Overype.
- Create and Edit files larger than memory.

The Assembler leatures include;

- Conditional w/Then/Eise assembly.
- Disk Library files up to 9 levels deep.
- Supports standard Motorola directives.
- Allows multiple values in FCB/FDB directives.
- Allows assembly from Bulter, Disk or both.

## Angles on the CoCo by Keiran Kenny J Keiran Kenny

This educational program offers an introduction to trigonometry. I think it is especially useful for those students at the elementary stage of education. With this program a student can enter base angles and actually see the height and base, and the sine, cosine and tangent values vary with each change of angle. This is much more effective than the blackboard scratchings of the Mr. Chalks in my long ago school days.

The triangle has a fixed hypotenuse of length 150 . You begin with a prompt to enter an angle from 5 to 85 degrees. With
less than 5 or more than 85 degrees, the triangle will not be convincing. You can type an angle with up to 16 digits after the decimal point. The entry routine is in lines 70 through 190 . Whatever is entered emerges as a string, $V \$$ and a value, $V$.

Use the left arrow to backspace and delete errors. Re-type the information and then press ENTER. Line 50 stores a 16 -by-16 blank rectangle in the buffer for use as an eraser. The eraser routine is in lines 100 through 140.

When you press ENTER the triangle appears on the screen with its angles

## T\&D Software's Cassette \#93

T\&D Software's Cassette $\# 93$ packs a variety of programs for work and play. There are 10 programs altogether; four arcade-type games, three databases, two quizzes and one text adventure.

Of the four arcade-type games, two of them, Invaders and Doctor Who3, are space invaders shoot'em up games that require a joystick. With Invaders you are moving across the bottom of the screen, shooting at and dodging rows of moving blocks firing at you. Doctor Who3 has you in the air sailing between a moving, shooting laser beam while individual spaceships crash into you.

The third game, Drop Pack, is a Tetristype game that requires you to rotate different shaped pieces to fill a wall. The fourth game is Grabber. It challenges you to gather boxes from eight comers and place them inside eight rooms without being zapped by other faster moving grabbers who randomly appear to undo your work and to chase you.

The most entertaining game in my opinion is Grabber. This is due in part to its cheerful monkey-grinding music that keeps your shoulders bouncing in sync with the little grabber on screen (at least mine did).

The three database programs, Mr. Movie, BabySitter and CoCo3 Recipe Machine, store information for easy recordkeeping. Mr. Movie files the specifics for the homevideo movie maker who can't remember which tape he put Aunt Sarah's 94th birthday party on. For easy access the program records specifically where on the tape that rare footage is squeezed.

BabySitter keeps a list of clients, their addresses, phone numbers, kids' names
(they're numbered for easy memorization) and pay rate. It then adds your total income to date for each individual client. It gives the business of babysitting a professional flair.

The CoCo3 Recipe Machine categorizes each recipe and lets you conveniently look for and print copies of recipes for connoisseurs awed by your feats in the kitchen. If you're stingy about sharing your secrets, and feeling a tad bit sly, use the Edit feature to delete one of the recipe's ingredients before printing it. Of course, you may be choosing Uncle Joe's Underground Baked Beans over your best friend.

I suppose if you don't make home movies, babysit or cook in any great capacity, the database programs may not prove to be much of an organizational timesaver. However, the babysitting program is a good way to record your earnings for tax purposes if you have a large amount of this work and an unswerving loyalty to Uncle Sam. All three programs let you print and save to disk. You can save Mr. Movie data to tape.

Time for two quizzes. How well-versed are you in Bible scriptures? OK, then identify the following quote: "Pride cometh before a fall." If you can name the book, chapter and verse, you might be able to handle the brutally tough Bible Scripture quiz program. It's demanding, but have faith and remember that even if you miss all 53 questions, God is merciful. Just humbly move on to the vocabulary quiz.

Now, how well-versed are you in the English language? Do you consider yourself to be a glib, recapitulating charlatan or a vociferous braggadocio? I hope neither because one's a smooth-talking quack and the other is a loud-mouthed braggart. Just checking. Anyway, you can be either and still take this vocabulary quiz that includes up to 100 questions. Vocab is fun if you enjoy learning new words. Its one shortcoming is that there aren't enough questions and after a short while there is nothing new to leam.

Silvercape is Cassette \#93's only text adventure. It takes you on a joumey to find the lost Lord Silvercape who's been cursed by an evil witch. Most of the adventure takes place inside a castle where death awaits behind uncertain doors. Open one of these and it's back to the drawing board. There are four windows above the text; one for directions, one with graphics showing where you are, one that tells you what items are in the room and one that tells you what
items you are carrying. The adventure moves along at a good pace, the riddles and anecdotes are not overly difficult and the graphics window helps you remember your way around, although parts of it you should map along the way. Silvercape would be entertaining for hours if it had a Save feature. After going through every passage, curse, guard and dragon; you might suddenly find yourself back in the death chamber, which may cause you to put the game away for a week or so.

T\&D Software gives you a lot for your money. Even if you have no use for the database programs, couldn't care less about broadening your vocabulary and feel that Bible-scripture computer drills somehow detract from the intimacy of such a book, the arcade games and text adventure alone are well worth the price. These programs are designed for beginners, and they come with brief, simple instructions.
(T\&D Software, 2490 Miles Standish Drive, Holland, MI 49424; 616-399-9648; \$8)

Utility 05-9

## The Goldberg Utilities

As most CoCo users know, os-9 is a powerful and flexible operating system loosely based on the Unix operating system from Bell Labs. In addition to the obvious differences in hardware, there are also fundamental differences in the way the two operating systems are used. The OS-9 system comes with approximately 30 utilities, many designed to be used as stand-alone programs. An average Unix installation, on the other hand, comes with several hundred small utility programs. Many of these are not especially useful when used alone, but can be combined with other small programs to do very complex tasks.

Since the early days of OS-9 for the CoCo , Stephen Goldberg has been writing small, useful utilities and filters. Some have appeared in THE RAINBOW, usually in Dale Puckett's "Kissable os-9" column. The best of the Goldberg utilities are now available in two volumes from Kenneth-Leigh Enterprises. Each program is small, fast and well crafted. Individually, only a few of these programs would make the average

OS-9 user take notice. But together, The Goldberg Utilities form a sort of tool kit for 05-9. The small programs can be combined using OS-9 pipes to perform some truly amazing feats. Since The Goldberg Utilities are available in two volumes, I will treat them separately. But I recommend the purchase of these volumes as a set rather than the purchase of one single volume.

The first volume contains 13 programs. Some are simple in both concept and use. These include $c$ is that clears the screen and val, a decimal-hex-binary base converter. There are also a couple of programs designed to stand alone and perform useful tasks. The first of these programs are named pk and unpk. pk is used to pack text files to save space, and unpk unpacks them when needed. Another program in this group is unload, which easily removes modules from memory. Also included is an enhanced version of copy. The enhanced version's biggest advantage over the standard version is that it allows for prompted overwriting of existing files with the same name as the one you are copying. It can also use a
large buffer to speed the copy process, especially during single-drive copying. Finally there is append. This program func-

## The Goldberg Utilities form a sort of tool kit for OS-9.

The rest of the programs can be used alone or with other programs to form new tools. These are some of the most interesting programs in the group. count is a small program that counts lines, words and characters. It has options to count any combination of these based on the command line parameters entered. Although count can be used to work on groups of files, it is most successful when used on a single file. The same can be said ahout the programs head and tail. These programs allow you to look at either the first or last lines of a text file. head is especially useful when I need to peek at a file to remind me of its contents. The output of tail can vary based on the command line parameters. It can either be the whole file minus the first n lines or just the last $n$ lines. The programs upper and lower convert files to all upper- or lowercase text. This can be useful for files created all in uppercase like bulletin board files. The sort utility is an in-memory sorter that takes its input from the standard input path and sends its output to the standard output path. This makes it most func-

tional when used as a filter along with other programs.

Another Unix-style utility in volume one is grep. The Unix version is unbelievably powerful, but difficult to use with many of its options. Goldberg's version of grep finds expressions in files. It also has options that allow case-specific matches, and the output can be numbered or totaled several ways. This one will take some time to master, but the results are well worth the effort.

I did not immediately appreciate the program named zcopy since I usually use another utility to do the same thing. This utility copies multiple files from one directory to another. It accepts a list of files to copy as standard input and since the filenames are not changed requires only the name of the destination directory for output. When used in conjunction with d, zcopy is an excellent tool for organizing messy directories.

The most useful program of the group is the directory lister, d. Unlike dir, d displays one filename per line and can serve as the first program in a pipe. It can accept wildcards to display certain files. It can also suppress those files. This is more difficult to describe than to use. For example the line ${ }^{d}$ *.ba? produces a list of all files that end in .ba plus one character, such as tempfile, bas and newfile, bak. Adding a - to the filename descriptor causes d to produce a list of all files except these. Used alone $d$ is not a real powerhouse, but when used to supply names to other utilities through pipes it is indispensable.

Volume Two consists of 12 more utilities that are just as useful as those in Volume One. The easiest to use are code and crypt. code prints ASCII codes of input characters and crypt encrypts or decrypts files for security. dsort permanently sorts the filenames in a directory. There is also an improved version of del that accepts filenames as standard input and doesn't abort on an error. Another enhanced version of an OS-9 utility is 1 is t, which also accepts filenames as standard input and numbers output. The enhanced version of dump adds options to read files in the execution directory or dumps memory modules. Finally, the version of save is either new or enhanced based on your version of os-9. Level in does not include a save utility. The Goldberg version has much better error handling capabilities than the Microware version which, in my opinion, makes it a better tool.

New utilities in Volume Two includemv and prep. mv copies a file to a new location and deletes the original. prep splits input into one word per line and converts each to lower case. Also included is comm which
compares two files line-by-line and then displays the results in column format. Output format is controlled by command line parameters. The strip utility removes characters from each input line according to command line parameters. It can remove the beginning or the ending of a line as well as all characters after a specified location in the line. It is also useful when removing excess information from tabular files and the left margin from formatted text files.

The power utility of Volume Two has to be rep, which allows you to repeat a command. The main advantage of rep is that it can repeat an operation that was not originally designed to be repeated. It provides increased flexibility by using a clever argument substitution system that works with other programs that cannot accept multiple input.

These descriptions are necessarily incomplete but give an overview of The Goldberg Utilities. The power of these programs is in their ability to work together. For added speed several of these utilities can be combined to accomplish the same amount of work in less time. The utilities are relatively small and can be kept in memory, which makes them faster and even more useful. Each volume comes on a single disk and includes adequate instructions with examples for each program. An appendix explains the most effective ways of combining separate programs into memory-efficient groups that can be loaded into memory and linked to make them a permanent part of your system. These packages go a long way in making OS-9 similar in style to the Unix environment and making you more productive. I really enjoyed testing and messing around with The Goldberg Utilities. I find them useful, fast, expertly crafted and well-designed. I highly recommend them to anyone using os-9, Level I or Level II.
(Kenneth-Leigh Enterprises, 1840 Biltmore Street NW, \#10, Washington, DC $20009 ; 202-462-1210$; each volume $\$ 24.95$ plus \$2.50 S/H)

- Don McGarry
Game $\operatorname{CoCo} 3$

## The Entity

The Entity is a new action-adventure game by Mike Snyder that will make you miss the simple days of earlier computer games. As a player, you become a bodiless alien life-form whose purpose is to perform 10 good deeds in a large American city. The
number of guesses available at the proper verb/noun combinations is extremely limited and you will have to re-start the game approximately every 20 moves. It is irritating to be unable to perform your assigned deeds. Irritation became frustration and soon I was tapping the CoCo keys with a bit more insistence.

Veteran adventurers will probably overlook the above mentioned irritations and finish the game in just a few hours. Less patient players who like to break and list a game to follow a programmer's logic will have the added irritation of breaking out the disassembler to unscramble this game's machine language.

The introductory graphics are nicely displayed and reflect the time and attention given to the aesthetic content of this package. The white-on-black text is easy to read despite a few grammatical and spelling errors. Each screen is loaded separately from the disk drive (a drive is required for The Entity.) This slows the game slightly, but response time to player's input is very quick. This may be due to an obviously shorl verb/noun list.

I strongly recommend the use of a map after your first few experimental adventures. The game counts your moves and records your score. You are awarded 10 points for each successfully completed good deed. Moves must be made very carefully to avoid the ominous Play Again? screen. To display your total points and number of moves used, enter SCORE. Note that this is counted as a move and is probably a waste of your time. STATUS is a command unique to The Entity. STATUS describes the body you currently inhabit. However, the use of this command counts against you as a move and should be avoided once all of the different bodies in the game have been memorized. Finding good deeds to perform is less difficult than finding an order in which to accomplish them without reaching the 20 moves-per-game maximum.

EXA (examine) and SEA (search) are useless in the various cells. SPE (speak) is not helpful either. This challenging game can often be quite lonely. But persistence is
rewarded with a nice congratulatory graphics display.

The Entity could be improved in many ways. First of all, the move number and score should be displayed on each input. An updated version of the screen should be shown after each move to reflect the changes made during play. I would eliminate the unnecessary wasting of moves. For example, it should not count as a move to look at a newly created scene. 1 also suggest the author consult a dictionary to correct the grammatical and spelling errors that exist. I am not an enforcer of proper English etiquette, but mistakes such as these can be very difficult to decipher. It is not always immediately clear whether an unaccepted command is really wrong or simply the result of poor grammar and improper spelling. Even though author error might be a good alibi when explaining a loss, it leads to massive confusion for the gameplayer.

The Entity is a virtually bug-free program from Biware Enterprises. In all the hours my children and I spent muttering over this exasperating little gem, it did not crash. As is characteristic of games that operate on three letter input, I received some strange responses to my commands. For example, OPE might be interpreted as
either "operate" or "open." And LEA as "lean" or "leave,"

I will not discuss the correlation between the package cost and the satisfaction of playing the game. I will instead leave that up to individual analysis.
(Biware Enterprises, c/o Kandi Stinson, Box 265, Allen, OK 74825, 405-857-9932; \$18)

- Mike Shay

Utility $\quad$ COCo $1.2 \& 3$

## CIII Lettrex

Many CoCo and other computer users have printers that produce only draft-quality print. There are thousands of printers still being used that have no built-in Near Letter Quality (NLQ) mode. This makes it difficult for computer users to make pres-entation-quality printouts of text files. Rather than investing in a new printer, CoCo users may now obtain NLQ without the cost. CIII Lettrex is a program that reads an ASCII text file from any CoCo word processor and
converts the printout to NLQtext in any one of 14 NLQ fonts. There are a few things you will need besides an Epson or Epson-compatible printer. You'll need a CoCo with 64 K or more memory, a mouse or joystick, and a disk drive. Two disk drives will speed operation. CIII Lettrex can also be of value to users with printers supporting NLQ fonts, such as Star NX-1000, who want more and /or different fonts.

CIII Lettrex is easy to use and welldesigned. The program functions as a filter for ASCII text. I tested the program on an $\mathrm{NX}-1000 \mathrm{R}$ printer. It performed well and printed quality text samples in the different fonts. In fact, the fonts were sharper and clearer than the manual portrayed. One thing that Coless Computer Design might consider is higher-quality printing and copying for their own manuals.

When the program begins, you are greeted with an opening screen and three point-and-shoot pull-down menus. Pick a baud for your printer, a font and a pitch. Then load a file and print it. This entire operation takes about as long as reading this paragraph. Once the font and baud have been set, there is no need to re-set them unless it becomes necessary due to the length of time you are in the program.

One feature that I really liked was the demo file. This is a $2^{1} / 2$-line file that allows you to see what your text will look like in the font you have chosen. If you like what you see, select Print with the mouse and the font loads and prints. Press E to abort printing. $P$ to pause printing and $C$ to continue printing after a pause. The program automatically senses whether or not your printer is online. If your printer is not online, click on the file box and repeat the procedure from the beginning. Also, there is good error trapping that will give you a big error box displaying an appropriate message and retum you to the main screen. So if you forgot to put a disk in, or format it, or left the drive door open, or typed the wrong file name, you can quickly recover. This is a very useful feature.

The documentation that accompanies CIII Lettrex is 24 pages long and has 18 figures to assist programming needs. There are also several font tables for font size and estimation of characters-per-line. The only complaint I have is the quality of the print in the manual itself.

If you have a word processor that leaves its control codes visible, your document will not print correctly. You must hide the control codes so they are not visible on the screen. Your files will then print in the prescribed order.

This is a package that is well worth the required investment.
(Coless Computer Design, 1917 Madera St., H8, Waukesha, WI 53186; 414-549-0750; $\$ 24.95$ plus $\$ 3$ S/H)

- Jeffrey Parker

## Desktop Publishing

CoCo 3

## CIII Pages Enhanced Version 2.0

I recently had the pleasure of stacking some pretty exciting CoCo desktop publishing packages against one another in an article for THE RAINBOW (May 1989). If CII Pages Enhanced had been part of that article, it would have received some high marks in certain areas and low marks in other areas. Then in February 1990, Jim Issel, a noted RAINBOW reviewer, looked at the original CIII Pages. He was not entirely thrilled by it. Many of his comments about the program produced responses by the program's author, Walter Bayer of Coless Computer Design. Walter took the comments to heart, and in less than six months
he had completely rewritten several of the more criticized features of his program for an enhanced version. These enhancements and other improvements to this program are the focus of this review.

CIII Pages is a full-featured desktop publishing package for the CoCo3. Like its predecessors, CII Pages attempts to put as many different features as possible on the same screen simultaneously. At the same time, it relies on a wIMP (Windows, Icons, Mouse and Pull-down menus) environment to acquaint users with creating and editing. CII Pages operates with either 128 K or 512 K , though limited to one and three pages of editing respectively. All these tools in one place is good, but even with the required Tandy High Resolution Joystick Interface and a mouse, the left column is so crowded that you can often accidentally click on the wrong icon even if you are pointing at the right one. After a period of adjustment, I could work with these newly enhanced features.

Probably the most important upgrade to the package is its speed and smoothness of operation. With Version 20 the speed is dramatically improved. A hefty rotation or horizontal flip has been reduced from a several-minute wait to one of several seconds. Another enhancement is the requirement that the user choose the appropriate printer baud from within the program. This must be done when the program is first started.

The manual has grown from 68 to k 3 pages. The package now contains a separate reference card that is very useful. The text still has grammatical errors and is rigorous in places, hut the overall quality has improved. The font, as well as the quality of printing and reproduction make the manual appear "muddy" and unclear. The edges of the letters are poorly defined making the text difficult to read. The manual was printed with CIII Pages, but is not an accurate representation of the quality print produced by the program. CII Pages is now distributed on two double-sided, doubledensity disks. Both sides of each disk must be backed up before the program can be used.

Printer support has remained the same and the Undo function is still limited. If you use the Inven Box feature, the only way to undo it is to exactly match the size with the Inven Box feature. It seems as though there should be a better way to do this. The Text pull-down menu has been replaced with a Graph pull-down for clip-ant and picture files. The Text feature is still slow, and if you go too fast, you lose characters.

The user interface takes some getting used to, but is workable. Once an action on a panel has been completed, there is more than one way to get your frame back. The WIMP environment usually negates the necessity of having to read the manual, but with CIII Pages you must read the book first.

The program comes with more than 15 fonts, dozens of clip art images as well as enough unique graphics and text-import features to make it a strong contender in the CoCo desktop publishing market. What CII Pages lacks in finesse, it makes up for

> CIII Pages is a full-featured desktop publishing package for the CoCo 3. With Version 2.0 the speed is dramatically improved.

in muscle and brawn. Jim Issel said the program fills a gap in CoCo DTP. He also said this gap must be filled. I agree with both of his statements. This is an interesting and full-featured product that still needs further streamlining, but it is a good solid value and will get the job done.

New to CII Pages is the CII Clip Art Set 2 package for CHI Pages Enhanced Version 2.0. This is an outstanding value. Although CIII Pages is already loaded with clip an, fonts and borders, this set of clip art is excellent in both quality and quantity. There are 672 custom-designed images featured in categories labeled Creatures, Miscellaneous, Rad Concept, Weird, Symbols and D \& D Fantasy. This is my only criticism. Each 14 -clip file is labeled with one of the above, but they could be broken into
other themes such as Holiday, Religion, Sports, Business, etc. The accompanying manual provides a printout of each clip-art file to find what you are looking for. If you prefer to use the computer, a file viewer called $V$ is included with each clip-art disk. I was disappointed with the program at first, but when I loaded the art and printed it on a Star NX-1000 with the standard driver in CII Pages, I was impressed. This is a very good value for clip-art and/or CII Pages Enhanced users.

Clip art requires cII Pages Enhanced Version 2.0. Upgrading from Version 1.0 costs $\$ 12$, and you must return your original system disk and sales slip. CII Pages Enhanced Version 2.0 requires a $128 / 512 \mathrm{~K} \mathrm{CoCo}$ 3, a High Resolution Joystick Interface, a mouse or joystick, at least one disk drive and an RGB or composite monitor. This package will not work with TV. A mouse and at least two disk drives are recommended, as is a printer. Make sure your printer is supported.
(Coless Computer Design, 1917 Madera Street \#8, Waukesha, WI 53186, 414-5490750; CIII Pages v2.0, $\$ 49.95$ plus $\$ 3 \mathrm{~S} / \mathrm{H}$; CIII Clip Art, $\$ 19.95$ per set plus $\$ 3 \mathrm{~S} / \mathrm{H}$ )

- Jeffrey Parker

## Utility

05-9 Level II

## Planet Engine Version 1.1

Planet Engine Version 1.1 is an 05.9 Level II program with graphics to show the planets, stars and constellations. This program requires a 512 KCoCo 3 and OS-9 Level II. Multi-Vue, a mouse and a color monitor are optional, but recommended. The highresolution display mode used by this program makes a monitor desirable.

As Planet Engine begins, the screen displays celestial bodies along the ecliptic plane. The ecliptic plane is a band of the sky that includes the section inclined 50 degrees north of the Earth's equator to the section declined 50 degrees south of the equator. The main view shows planets, stars and constellations. A line traces the southern horizon, with the zenith pinpointed by a cross. The relative locations of the various bodies are determined by the time and also your location on Earth. Planet Engine displays stars, planets or constellations. Scroll bars can be used to change the time by hours or days.

The program contains three pull-down menus. The first menu provides access to the same features available under the Tandy icon in the Multi-Vue menu. The second menu toggles on or off the display of stars, planets and constellations. You can also change the date and time as well as your location on Earth. The time can range from approximately 32,700 B.C. to 32,700 A.D. And your location can, literally, be anywhere on Earth. The planets' orbits can be viewed in an overlay window. With the third menu you can view each planet in an overlay menu. The only drawback of this program is the lack of detail in the pictures of individual planets. These views do not fully exercise the CoCo's graphics capabilities.

Planet Engine is an extremely easy program to leam. I discovered many of the program's features through experimentation before reading the manual. This program can be operated with a mouse, but it also accepts keyboard commands. A 13 page manual that accompanies the program is thorough and well-organized. The manual takes you through backup and installation. It also gives you a sample question, information on the data displayed and instructions on using the various program features. Application ideas are included as well. For example, comparing the posi-

## Nine-Times

tions of two planets on different dates or viewing the sky from various locations are two suggestions.

The disk includes the program and its graphics files, in addition to icon and application information for Multi-Vue users. The program is not copy-protected and can run from any directory or subdirectory on a hard disk. Since the program is fairly diskintensive, a RAM disk or hard drive will increase the speed of the graphics. Planet Engine uses the Multi-Vue interface, but can run from the command line in a four color graphics window.

Planet Engine is a well-written program. The first time I used it, I accidentally failed to copy one of the many data files to my hard drive's subdirectory and the program still ran flawlessly. The only thing missing was a small section of the sky. As a test I ran the program a few more times with randomly selected data files missing and had the same results.

Planet Engine contains a wealth of pictorial information. It has helped me in locating constellations during observations of the night sky from my yard. It also allows me to watch the movement of consteliations, planets and stars over a period of time. This program would be an asset to teachers in grades 4-12, amateur astronomers or anyone else interested in the cosmos. For its usefulness and extensive data, Planet Engine is a bargain at $\$ 24$.
(Gravity Studio, Box 791, Belton, TX 765130791; \$24 plus \$2 S/H, \$5 S/H outside North America)

## Book

CoCo 1, $2 \& 3$

## Connecting the CoCo to the Real World

Would you like to retum an inactive, dust-collecting CoCo to exciting everyday use as a weather station? Why not make your CoCo a central control for a complete in-home burglar alarm system? Or perhaps you are not interested in these ideas, but would like to further expand your knowledge on the inner workings of the CoCo and have some fun, too. If any of the above applies to you, then Connecting the CoCo to the Real World by William Barden, Jr. may be just the book for you.

For a couple of years now I have enjoyed reading William Barden, Jr.'s column ("Barden's Buffer") in the Rainbow, as well as his books on assembly language
and graphics for the CoCo. So I was excited about the opportunity to review his latest book, Connecting the CoCo to the Real

World. I was only slightly disappointed to discover that a few of the projects in the book are simply transplanted from his monthly column. My disappointment was short-lived, though, as I soon leamed that there are enough new projects to keep his fans' interest.

The book and its projects are designed with the novice in mind. Knowledge of digital circuits and programming is not required to build, or use, any of these projects. All you really need to know is how to enter and save a program on your CoCo , as well as how to cut and solder wires. If you want to expand or improve any of these projects, though, you will need an understanding of digital circuits and programming with both assembly language and BASIC. After you've read the book and built some of the projects, it may be beneficial to leam even more about digital circuits and programming.

One chapter is devoted to the work of the CoCo's analog-to-digital circuitry. Other technical information on the inner workings of the CoCo are scattered throughout the book. This information is designed for those who want tolearn more about the way in which the projects and the CoCo work in tandem, but it is not necessary to build or operate the projects. Although after building a few projects, your interest and curiosity may increase enough to pursue a deeper understanding of the more technical aspects of these projects.

The cost of the projects vary, but none are outrageously expensive. All of the projects can be built for less than $\$ 20$ with average costs ranging from less than $\$ 5$ to
slightly more than $\$ 10$. These costs do not include a proto-board which is needed for several of the more complicated projects. This is an inexpensive item that can be purchased for about $\$ 10$ from your local Radio Shack.

For those who are familiar with Mr. Barden's column, the book will be easily understood since the projects follow this same style. For those unfamiliar with the Barden style, it can be summed up as the KISS (Keep It Simple Stupid) principle. The instructions are not step-by-step, but they are easy to read and follow. Barden offers suggestions on possible applications and expansions for the completed project. He also encourages exploration of your own ideas.

I had a few problems with the book. First of all I thought it was too short. I also found problems with the first few projects. Not with the projects themselves, but with Mr. Barden's failure to thoroughly explain formulas used to help analyze the readings and find resistances. These formulas are given with little explanation of their origin. While it is possible to build and use these projects without this knowledge, further expansion and changes to the projects without this information could be difficult. It may be necessary to do some reverse engineering to discover the origin of the formulas used.

Connecting the CoCo to the Real World is a good book that offers some atypical ideas on how to use the CoCo. The book is easy to read and the projects are both useful and fun. If you're not careful, there might even be some leaming amidst all the fun.
(William Barden, Jr., Box 3568, Mission Viejo, CA 92692, 714-589-8426; \$19.95)

- Chris Hyde

This next generation color printer sets new standards in color printer performance... 225 cps , 4 NLQ fonts including Script, plus a new high speed draft font; but the enhancements don't stop there. Add a 16 k buffer, a special quiet mode, top feed, bottom and rear tractor, and the list goes on. Seven on-demand colors, 8 color graphics modes, Epson and IBM emulation for maximum software compatibility. Virtually everything desired in a printer is here speed, color and versatility at an affordable price with a 2 year warranty.

## OUR PLUG 'N GO FOR THE COCO SYSTEM INCLUDES:

- NX-1020 Rainbow Multi-Font Printer
- Blue Streak Ultima
- Software Support Disk**
- Color Screen Dump Utilities

All Dayton Associate's products have a 30 day moneyback guarantee. All printer systems are "Plug ' $n$ ' Go for the CoCo".

Epson is a registered trade mark of Seiko Epson Corp
IBM is a registered trade mark of International Business Machines Price and Specifications are subject to change without notice.

## NX-1001 MULTI-FONT

#### Abstract

The following products have recently been received by THE RAINBOW, examined by our magazine staff and issued the Rainbow Seal of Certification, your assurance that we have seen the product and have ascertained that it is what it purports to be.

Math.l, a high-level math functions library for OS-9 and the C compiler. Includes $\sin , \cos$, tan, arccos, trunc, pow 10 , and many other useful math functions. Bits-N-Bytes, 4140 Victory Drive SW, Port Orchard. WA 98366: \$27.42.

MVDWG 1.0. a program that displays drawing fites from the Multi-Vue main screen. You can doodle or erase on files or get a fresh re-display all by mouse clicks. Multi-lasking allows medwg to run as many drawing windows as resources permit. Requires a 512 K CoCo 3 , OS-9 Level II, and Multi-Vue. Gravity Studios, Box 791, Belion, TX 76513-0791; \$7,\$2 S/H.

Data Windows, an OS-9 database that can be run under Muifi-Vue. Data Windows also works withoui Mulfi-Vue. Full database support includes user-definable fields, multiple-key fields, automatic soring, fast searching, browsing, user-definable edting, userdefinable windnws, impor/export/merge capability, $\mathrm{cut} / \mathrm{copy} / \mathrm{paste}$, and report generation and mailing label facilities. Requires 512 K and OS-9 Level II. Alpha Software Technologies, 210 Bhefield Drive, Slidell, LA 70458, (601) $088-3140 ; \$ 5995, \$ 3 \mathrm{~S} / \mathrm{H}$.

Delta Pro, a digitizer hardware unit. It uses she Delta format for record and playback. Delta allows highquality audio recording and playback at low sampling rates. Sanpling fates as low as 1 K per second still provide good audio quality. Software support programs are included on disk. Full programming instructions are given for development of personalized programs using the pack. This digitizer can digitize a $50-\mathrm{KHz}_{2} 5$-volt sine wave to 8 -bit accuracy. Mic and line level inputs as well as headphone output are included. Requires 64 K , disk version 1.1, and MultiPak or Y-cable, Lucas /mdustries 2000, 14720 Cedar Si. N.E. Alliance. OH +4601, (216) 823-4221, \$129.95 plus $\$ 4$ S/H. 10 day free trial offer.
K.JV on Disk \#14, Il Kings from the King James version of the Bible, in ASCII files for the CoCo 1.2 or 3. A word processor or text editor is recommended for viewing the files. Requires 32 K and disk drive. BDS Software. P, O, Box 485, Glenview, IL 60025 . 0485; \$3.

## The Rainbow Indexes, a two disk package con-

 taining databases for ten years of RAINBOW articles, reviews, and RAINBOW ON TAPE/DISK. CoCo $1 \& 2$ and CoCo 3 versions supplied on disk. Minimum requirement is 32 K and disk drive. Rick Cooper. P.O. Box 276. Liberty, KY 42539: $\$ 10$.CoCo-Cassette 98 , a monthly collection of software programs that includes: Flippy Tutrial (how to make floppy diskettes out of nippy diskettes), Recipe/Meal/ Grocery (stores recipes on tape or disk and helps pian meal combinations). Dungeon Maze (3-D type Adventure), Snow Ski (joystick controlled ski game). Hot Load (a TSR program that will run BASIC or Machine Language programs), Ship War (graphics game played against the computer). Error Trap (al-
lows you to abon, retry or ignore errors), Space War 3 (two-dimensional outer space battle game for the CoCo 3), Maze Master 3 ( CoCo 3 graphics maze game), Wizard's Den (a graphics adventure). T\&D Software, 2490 Miles Standish Drive. Holland, MI 49424, (676) 399-9648: \$8.

512K Copy Utility, designed to make full use of a 512 K CoCo 3 . This utility will format disks $25 \%$ faster than BASIC's DSKIMI command. Also has simplified kill and rename commands. Its real power is in copying files. Select files to be copied or use the all files option. If you are using a single-drive system, constant disk swapping is eliminated because 512 K of RAM can hold all the files on your disk, even 80 tracks. Carl England, 128 Shepherd Drive N.E., Calhoun. GA 30701, (404) 629-7197; \$15.

Space Age, an action adventure. You must explore four zones of a space station and destroy Iravo, the master control computer. Written in machine language, Space Age will take you through dozens of Hi -Res 16 color rooms. The game includes Pause and Quit features, and a limited continue feature that lets you continue from the point where you were killed. Requires a CoCo 3 , a disk drive and a joystick. Biware Enterprises, C/O Kandi Stinson. P.O. Box 265 . Allen, OK 74826:\$20.

Directory Library, gives you the ability to easily organize and manage your library of CoCodisks. The program manages an unlimited number of diskettes and accommodates single, multiple, and double-sided disk systems. Features include add, update, view, print, search, erase, and special name. Search the library of directories for a specific program or data file and be informed of its resident diskette. Use the special name feature to include OS-9 disks to the library. Requires a $0 \mathrm{Co} 1,2$ or 3 with a disk drive and any compatible printer (optional). Johnson Soffware, P.O. Box 92, Dayton, OH 45449, (5/3) 866-2601; $\$ 17.50$ plus $\$ 2$ S/H.

KJV on Disk \#15, I Chronicles from the King James version of the Bible, in ASCII files for the CoCo I, 2 or 3. A word processor or text editor is recommended
for viewing the Tiles. Requires 32 K and disk drive. BDS Softhare, P.O. Box 485, Glemview. IL 60025 0485: \$3.

Scripteller, is a user-friendly program that enables the user to analyze handwriting and obtain an interpretation of the writer's character and personality. Requires a CoCo 3 and disk drive. A printer is optional. E.Z. Friendly Software, 118 Corlies Avenue, Poughkeepsie, NY 12601, (914) 485-8150; $\$ 26.95$ pius \$1.50 S/H.

Picture Disk \#1, this disk package contains four picture collections: People, School, Sciencel, and Science2. Each collection contains 30 pictures. The picture files are CoCo Graphics Designer-compalible. Supplied are conversion utilities to generate CoCo Max, CoCo Max II, CoCo Max III, and Max 10 format compatible disks. Zebra Sysiems. Inc., 121 S. Burrowes Sircet, State College. PA 16801, (8/4)237 2652; $\$ 14.95$ plus $\$ 3 \mathrm{~S} / \mathrm{H}$.

DS69VIEW, a viewer for the DS69A/B 16-Jevel. digitized, . PIX pictures. Presents choice for viewing files on an RGB or composite monitor. Includes instructions and eight hi-res, 16 -level digitized pictures. Steve Ricketts, 10625 SE 362nd \#B32, Boring, OR 97009, (503) 663-7169; \$3 S/H. Also available from Delphi in the CoCo 3 Grophics Database.

Turbo DOS, an altemative DOS for the CoCo . Features include customizable palettes and startup message, a new WIDTH 64 command, reset protection, modified DIR and o05 commands, disk labeling program, works with 35 - or 40 -track, single- and double-sided drives, color burst disabling, key repeat, hotkeys, repeat last command, and more. After customizing your Turbo DOS it can be bumed into an EPROM or be run out of RAM. Jeffery Bornes, 3699 N. 175 E. Bax 60, Warsaw, IN 40580; $\$ 25$.

MINIGOLF?, an 18 -hole miniature golf game. You must make par to advance to the next hole. Hill, tube. and blow-bar hazards present an interesting challenge. J.T. Rawlinson Software, 36/ St. Germain Avenue, Toronto, ON MSM IW6 Canada: $\$ 21.95$ plus $\$ 3$ S/H.

First product received from this company

The Seal of Cerrification is open to all manufacturers of products for the Tandy Color Computer, regardless of whether they advertise in THE RAINBOW.

By awarding a Seal, the magazine certifies the program does exist - that we have examined it and have a sample copy - but this does not constitute any guarantee of satisfaction. As soon as possible, these hardware or software items will be forwarded to THE RAINBOW reviewers for evaluation.

There has been a strong interest for several years now in video frame grabbers for the CoCo. Products like The Micro Works DS. 69 series have sought to serve this interest, but most of these products have been strictly black and white devices with no color capability. There remains an unfilled demand for a digitizer that actually captures color images. The Rascan digitizer is a product that might just meet this demand. This product. developed in Australia and sold by Supersoft, allows you to capture and display fullcolor pictures as well as ligh-quality black-and-white pictures with a CoCo 3. Rascan even allows you to produce images in 3-D.

The Rascan digitizer is a bit different from most other digitizers. It plugs into the CoCo 3's joystich ports imstead of the expansion port and can. therefore, be used without a Multi-Pak Interface. The box has a video input (RCA-type phono jack) that works with almost all home video equipment. The unit also has brightness and contrast controls, a power switch, and a second switch to control a filter that is used to keep
the color portion of a TV signal from interfering with the process. To set up the digitizer, feed your chosen video source into the input and plug the two cables into the joystick ports. Then put a copy of the driver disk into Drive 0, type "RUN CONFIG" and press ENTER. After setting the monitor type (for an RGB or composite monitor), press FI to save the settings.
"RUN BOOT" starts the program and produces the Main menu. You must then select the desired mode. Choose 6+0 by 200 with dithering for 16 levels of gray, 6-40-by-20 with four actual gray levels, 320 by 200 with 16 colors or the 4090 color mode. The 4090 color mode works only on a $512 k$ system. but the normal black-and-white modes work in either I28k or 512 K . To begin the digitizing process, get the video signal ready, select the Capture Image option and switch on the Rascan unit. The menu disappears and a thin bar sweeps from right to left on the display. The next step is to adjust the brightness and contrast controls to get a clear image with good gray tones. Next, use the ALT and CIRL heys to center the picture vertically. The left and right arrow keys
center the image horizontally. When the bar disappears at the left of the sereen. press BREAK, switch off the Rascan unit and press BREAK again. The image is now in memory and can be saved to disk. Rascan black-and-white image files can be loaded into Mas-10. CoCo Max II or Color Max 3. But the 16 -color, false-color mode is the preferred method for importing files into the latter two.

The video source can be almost anything that provides a composite video signal. but since the system takes about 15 seconds to scan the image, the image must remain stationary during this period. The best way to take pictures of stationary subjects or artwork is to use a camcorder on a tripod to tape the subject for a few minutes and then play the tape into the Rascan unit later. In some cases you might be able to freeze a frame on the VCR. but this will not work well on most deck so it's advisable not to use still pictures. Laser videodises will do just fine if the dise was recorded in the 30 minute Cav mode. Many newer player have a digital memory, which will create still frames from any dise.

Join DELPHI and educate your disks with public domoin programs from the world's premier online CoCo library. DELPHI's Color Computer oreo is monoged by Marty Goodman, so you know you'll find lots of great stuff.

Downloods are only $\$ 6.00$ per hour, with no surcharge for high speed access and no premium for dialing locolly vio Tymnet. If you hove many floppy disks or a large hard disk, join DELPHI's 20/20 Advantage Plon and enjoy downlooding 20 hours each month for $\$ 20$.

As a Rainbow subscriber, you get a FREE lifetime DELPHI membership ( $\$ 29.95$ value) which includes o credit warth one evening hour of use. If you don't olready subscribe to Rainbow, just request a subscription when yau signup ta DELPHI ond, for the $\$ 28$ subscription fee, you'll get the same great deall

With yaur Color Computer and modem:

The big feature of the Rascan system is its color and 3-D capability that requires a 512 K system and a little maneuvering. The

Rascan unit is purely a black-and-white device and is not equipped to decode composite color signals. To achieve color, the software takes three separate scans of the image (one each for red, green and blue) and drops them into separate RAM buffers. It then displays each in sequence 60 times a second in their respective colors. This is accomplished through a set of color filters that comes with the system to take three separate shots of the subject on tape, one with each filter held in front of the lens. The
software allows you to select which buffer to use at any given time and get the images into the right places. When this has been completed, the 4096 -color display mode puts the full color image on the screen. The 3-D mode works much the same way except you take two pictures without filters (one for left, the other right) with the camera moved four inches to one side between shots. Then drop the images into the red, green or blue buffers. To view the result, use a pair of red/blue or red/green 3-D glasses, which may have been bought a few years ago to view a special 3-D movie shown on local TV. The yellow/purple glasses used for the 1989 Super Bowl halftime show won't work.

The Rascan system produces high-quality digitized pictures, though good results take some time and practice. Tonal gradation is very good once the brightness and contrast are set up properly, and resolution is acceptable at about 250 lines both horizontally and vertically. (This is somewhat better than the horizontal resolution of a typical home VCR.) A minor flaw is that the area of the image captured is about $83 \%$ of the vertical area ( 200 lines out of a total field of 241 ) and about $75 \%$ of the available horizontal area. This can be moved to any desired portion of the image, but it may be
a limiting factor in some cases. As the different ratios would imply, the image is somewhat stretched horizontally and people may appear fat.

The color and 3-D display modes have a problem in that the field-sequential technique used to display two or three buffers at once causes a strong flicker effect. This can be reduced by darkening the room lights and tuming the monitor or TV contrast down, but some flicker will still remain and may be somewhat bothersome. The flicker has no effect on still photos of Rascan displays taken from the monitor screen as long as you use a shutter speed of $1 / 4$ second or slower.

Printer drivers are availahle for Epsoncompatible and CGP-220 printers. Reviews of these optional products are forthcoming.

Despite the flicker in the color modes and the somewhat tricky brightness and contrast adjustments, the Rascan system is the best Color Computer digitizer I've ever seen. I have no qualms about recommending it to the serious CoCo 3 user.
(Supersoft, Inc., 363 Oakwood Avenue, Jackson, MI s9203; 517-787-3610; $\$ 199.95$ plus $\$ 6$ S/H)

ACCOUNTING SYSTEMS

INVENTORY CONTROL/SALES ANALYSIS
This module is designed to handle inventory control, with user defined product codes, and produce a detafled analysis of the business' sales and the sates force. One may enter/updale inventory data, enter sales, run five sales analysis reports, run five inventory reports, set up product codes, enter/update salesman records, and update the SBAP inventory.
$\$ 59.95$

## PAYROLL

Designed for maintaining personnel and payroll data for up to 200 hourly and salaried employees with 8 deductions each. Calculates payroll and tax amounts, prints checks and maintains year-to-date totals which can be automatically transferred to the SBA package. Computes each pay period's totals for straight time, overtime and bonus pay and determines taxes to be withheld. Additional outputs Include malling tist, listing of employees, year-to-date federal and/or state tax listing, and a listing of curreat misc. deductions. Sulted For use in all states except Oklahoma and Delaware.
$\$ 59.95$

[^5]
## ACCOUNTS RECEIVABLE

Includes detalied audit trails and history reports for each customer, prepares invoices and monthly statements, mailing labels, aging lists, and an alphabetized customer listing. The user can deline net terms for commercial accounts or finance charges for revolving accounts. This package functions as a standalone $A / R$ system or Integrates with the Small Business AccounlIng package.
\$59.95

## ACCOUNTS PAYABLE

Designed for the maintenance of vendor and A/P involce files. The system prints checks, voids checks, cancels checks, deletes cancelled checks, and deletes paid A/P invoices. The user can run a Vendor List, Vendor Status report, Vendor Aged report, and an A/P Check Register. This package can be used either as a standalone A/P system or can be integrated with the Small Business Accounting Package.
$\$ 59.95$

## Ordering Information

Add $\$ 3.00$ shipping \& handling, MN reaidentr add 66 sales tax Viss, Mastercard, COD (add \$3.50), permonil checks.

## BreakPoint

## 'tis the C Zen

by Greg Law<br>Technical Editor

Reading and writing files with BASIC09 should by now no longer be new information to you. Now we will cover the same concepts with the C compiler. Most of the techniques are similar, but there are differences. There are even a few pitfalls thrown in for good measure. In review, we discovered three basic types of $/ / 0$ operations with BASIC09: interactive, sequential access and direct access.

Interactive access uses the INPUT and PRINT commands to get data from the user and print it on the screen or printer. I call it interactive since the INPUT command allows you toedit your input before you press ENTER. Also, both commands are primarily intended for interactive prompts and queries to the user.

Sequential access uses the READ and WRITE commands to read and write ran-dom-length sequential records that are often stored in memory as a single structure. If you recall our recent discussions, each field and record is terminated by a known character in sequential access files. Keep in mind that these two commands do not readily lend themselves to printing prompts on the screen or printer due to the use of field and record terminator characters.

Direct access uses the GET and PUT commands to read and write fixed-length records, which are also stored in memory as a single structure. This allows you to quickly locate and retrieve any record within a file by calculating the offset of the record. This is accomplished by multiplying the record number by the size of the record.

In addition to heing os. 9 Online stgop, Greg Law enjoys programming onall types of computers and has worked on systems. ranging from the CoCo to the Burroughs B6700 super nainframe. He fives in Louisville, Kentucky.

There are only two basic types of input/ output operations in C. buffered and unbuffered. Even though there are only two types of operations, the differences be-

tween them can be very confusing to the novice. These two operations can be further divided into dozens of subcategories. These subcalegories are grouped into routines for singular data types (character, integer. long and floating point), routines for multiple data types, specialized data conversion routines and miscellaneous routines.

The good news is that there are direct counterparts to BaSIC09 $1 / 0$ commands. For simplicity's sake we will first examine these. The differences between Disk BASIC and BASIC09 were covered in the September 1900issue of THERAInBOW (Page 28). In the first example a very simplistic command is
given to open a file. The same operation in C is very similar:

```
10t path:
path = open("dataflle.dat". I):
```

First, a variable is declared that will be used to hold the retumed path number. The open() function is called with the name of the file and the access mode as arguments. The access mode specifies the operations that can be performed on the file and is either 1 for reading, 2 for writing, or 3 for reading and writing. Note that open() returns the path number as an integer value, much the same as Basicos. The big difference here is the method used to obtain the returned value. Also, the open() retums negative one $(-1)$ if it cannot open the file and, unlike BASIC09, C performs almost no error handling for you. For this reason, the value retumed should be tested to determine whether or not an error occurred.

```
int path:
path = open(*dataflie.dat*, 1):
if(path - - 1)
    exit(errno):
```

In this case the routine attempts to open the file, then tests path to deternine whether or not an error occurred. If an error is detected, the program is terminated by calling exit () with the value of errnoas an argument.

Many of the library functions, especially those dealing with $1 / 0$. are little more than delegates between you and the operating system itself. For example, open() does nothing more than place the address of the filename and the access modes into the registers and performs the I sopen system call. The operating system attempts to open the file and returns the results to open (). If the file is successfully opened, the path number is returned in one of the registers

## Submitting Material To Rainbow

Contributions to the rankow are welcome from everyone. We like to nun a variety of programs that are useful. helpful and fun for other CoCo owners.

WHAT TO WRITE: We are interested in what you want to tell our readers. We accept for consideration anything that is well-written and has a practical application for the Tandy Color Computer. If it interests you, it will probably interest lots of others. However, we vastly prefer articles with accompanying programs that can be entered and run. The more unique the idea, the more the appeal. We have a continuing need for short articles with short listings. These are especially appealing to our many beginners.

FORMAT: Program submissions must be on tape or disk, and it is best to make several saves, at least one of them in ASCII format. We're sorry, but we do not have time to key in programs and debug our typing errors. All programs should be supported by some editorial commentary explaining how the program works. We also prefer that editorial copy be included in ASCII format on the tape or disk, using any of the word processors currently available for the Color Computer. Also, please include a doublespaced printout of your editorial material and program listing. Do not send text in all capital letters; use upper- and lowercase.

COMPENSATION: We do pay for submissions, based on a number of criteria. Those wishing remuneration should so state when making submissions.

For the benefit of those wanting more detailed information on making submissions, please send a self-addressed. stamped envelope (SASE) to: Submission Guidelines, the ransbow. The Falsoft Building, P.O. Box 385, Prospect, KY 40059. We will send you comprehensive guidelines.

Please do not submit material currently submitted to another publication.
and open() retums this path number to you. If an error occurs, the carry flag in the condition codes register is set and an error code is placed into one of the registers. In this case, open() stores the emor code in erroo and retums -1 .

You probably think the process of opening a file and checking it for an error condition is long and drawn out. One of the prime advantages of C is the ease with which such tasks can be shortened. In the above code path is assigned the value returned from open() and compared against -1 . Shortening the logic a litte, we basically have the following form:

$$
\begin{aligned}
& a-b ; \\
& \text { if }(a-1)
\end{aligned}
$$

Do you remember the basic laws of algebra? Given an equation, the value for a given variable can be determined through mathematics:

$$
\begin{aligned}
& 2 x+y=12+x+y \\
& 2 x-x+y=12+y \\
& 2 x-x=12 \\
& x=12
\end{aligned}
$$

Let's apply this formula to our code. In the following section, $a$ and $b$ are used to represent an arbitrary variable or function.

$$
\begin{aligned}
& a-b ; \text { if }(a--1) \\
& (a-b) ; 1 f(a--1) \\
& \text { (f( }(a=b)--1)
\end{aligned}
$$

By now you must think I've gone stark raving mad. If you do not understand the connection between the laws of mathematics and the process 1 used to derive the short-hand notation, follow along closely as the technique unfolds. Given the assignment statement $a-b$, isn't $(a-b)$ the same? The parenthetical enclosure of the assignment statement has no effect so it must be the same. And isn't $(a-b)$ the same as $a$ ? It is since $a$ and $b$ are both the same. Then the results must be equal. The parentheses are added to the assignment statement so that the assignment operation is performed prior to the comparison. Whew! Checking our work, the original statement is:

```
path = open("datafile.dat", 1):
if(path - -1)
```

Since path is assigned the value retumed from open(). we can assume these are equivalent. Therefore, the following must also be true:

1f(open("datafile,dat", 1) - -1)

The only difference is that path is completely dropped from the formula, which makes the results useless. In other words. the file may be opened but it isn't helpful since we tossed the path number into the bit bucket. With this logic in mind, we should be able to finalize the statement as:

1f(path=open("dataflle.dat".1)=-1)
Although this looks correct and may indeed be mathematically correct, it is logically incorrect. The reason is a four-letter word known among C programmers as precedence. This one curse word renders the above statement useless. Because the comparison operator $(-)$ is higher on the precedence chart than the assignment operator $(-)$, the above statement is the same as:

```
temp = open{"datafile.dat", 1);
path - (temp - - 1)
```

That is, if temp is assigned a value of -1 , the comparison isTrue (1). Otherwise the comparison is False (0). A bizarre side effect causes path to be assigned a value of True orFalse based on the results of the comparison. Because of the rules of precedence, we must enclose the assignment operation within parentheses to force the compiler to perform the operations in the desired order. Our final result is

```
If((path=open("datafile.dat",1))-1)
    extt(errno):
```

Now you know why precedence is often referred to as a four-letter word. I urge you to locate a book with the precedence chart in it. Copy that page, cut it down to size and paste it on a wall or monitor within easy reach. And it may help to remember my motto, "If in doubr, add parentheses!" Remember, it is better to be safe than sorry. Stay tuned next month for the continuation of our discussion of file $1 / 0$. By then we should have a few examples to better illustrate these concepts.

## Starting Our 15th Year!!!

Of significant importance to you, the Tomcat is manufactured by Frank Hogg Laboratory, a leader in the Color Computer market since its inception. FHL has been in business since 1976 and has manufactured computers for more than six years. We have served many users since we started. Some of the more recognizable ones are:

3M, AT\&T, ADP, AC, Air Canada, Allied, Autolite, Bell Aerospace, Bell \& Howell, Boeing Airplane, Capitol Video Comm., Dolco, Eastman Kodak, Fairchild Space Company, Fermilab, Firestone Tire \& Rubber, Ford Aerospace, Ford Motor Co., GM, General Dynamics, GE, GMC, GTE, Hoffmann-La Roche, Honeywell, International Paper, McDonnell Douglas, Microware Systems, Monsanto, Motorola, NASA, Naval Weapons Center, Northern Telecom, NYS DOT, Okidata, Perkin-Elmer, Principal Group, RCA, Robertshaw, TAW., Texaco, Union Carbide, Unisys, US Into Agency, Pratt \& Whithey-Canada, Western Electric, Wright Patton AFB, Universitios of... Notre Dame, Nevada, So. Cal, Mo., NC, Monteal, Alberta, Ark., Calit, Kansas, Maryland, Mich., Pa., and Yale, to name just a few. As an FHL customer, you are in very good company.

# Tonsear The CoCo 4 that Tandy should have made! 

The TC9 Tomeat is the ONLY computer that will use your existing hardware AND software!

TC9 Tomcat is the affordable, logical upgrade path for your CoCo 3 . And it is from a company which has a long and proven track record in the CoCo market -Frank Hogg Laboratory.

This is the new Color Computer Tandy should have built! And it is your computing answer for the 90's.

What the TC9 Tomeat is and why it should be your next computer.

The TC9 Tomcat is a major improvement over the CoCo 3.

The TCs Tomeat is $100 \%$ compatible with all your present CoCo hardware AND software* with no modifications necessary. ("using optional FHL RSDOS software, OS9 AutoBoot is INCLUDED!)

The TC9 Tomcat supports 1 megabyte of on-board RAM!

The TC9 Tomcat has two serial ports.

The TC9 Tomcat has one parallel port.

The TC9 Tomcat has 33\% better sound and joystick resolution.

The TC9 Tomcat has an internal speaker.

The TC9 Tomcat has a PC style power supply.

The TC9 Tomcat uses a 101 key detached keyboard.

The TC9 Tomcat comes in a stylish enclosure that will hold all your cartridges and drives, imagine, no more messy wires!

What is significantly important is that you can use all of your present software with the Tomcat! Right. You don't have a major expenditure for new software.

## The Software Advantage

Your new Tomcat is compatible with Radio Shack DOS. It will run all of the programs you use every day. As an OS-9 machine as well, it will also work with all OS-9 software you either own now or plan to buy in the future. All of your CoCo cartridges like those from Disto and Burke \& Burke and ROMpaks will work with your new Tomcat as well.

But there are even greater advantages to the Tomeat system -- and an affordable path to upgrade your CoCo without losing any of the value you have in your CoCo system today.

Tomcat is also compatible with the FHL K-Bus, which means you can interface it to a 68000 CPU , or even the 68030. While that sounds very technical, the truth is it is as easy as plugging in a couple of boards. Yous do NOT need to have a 68000 to use your TC9 Tomcat, but you CAN when and IF you want to. And once it is done, the Tomcat be-
comes just like two computers in one your own, reliable (but faster and more powerful) COCO , and a 68000 -based computer which will run OS-9 programs 30 times faster than before.

Most important to you, this is upgrading without throwing anything away! All of your present software will work. All of your carridges, disk drives, printers will just connect into place. New horizons open with new software and new boards which will make your own CoCo continue to be your cost-effective, friendly helper and companion as computing moves into the 90's.

## To Order

The TC9 Tomcat with 512 K RAM, in a Mini-Tower case is only $\$ 499.95$. The case has plenty of room for your drives and other cartridges.

The 101 key Keyboard is $\$ 69.95$.
The 8135 monitor is $\$ 299.95$.
Many other options are available, please call for more information.

The TC9 Tomeat board is only $\$ 299.95$ with OK for those who wish to build their own systern.

Send for FREE descriptive brochure/ pricelist and get our FREE newsletter.

The TC9 Tomcat, designed for the future... built for today!

## WHAT IS IMS?

IMS is a powerful and flexible database and application development system for OS9. Programs can be developed in $20-$ $30 \%$ of the time required by languages such as C or BASIC. IMS was designed to make it easy to create business applications and manipulate large volumes of data.

The IMS development system includes everything you need to start developing applications. You get the executive menu, run-time interpreter, program compiler, database generator, screen form generator, report generator, interactive environment, text editor and utilities. Also included is a complete tutorial to get you up to speed in as short a time as possible.

## WHO NEEDS IMS?

IMS is for the end-user who is frustrated with 'filing' programs that are too limited for real business.

IMS is also for the applications developer that needs to quickly develop powerful applications. IMS is excellent for accounting programs, mailing list, inventory/invoicing any application that depends on efficient data storage.

The norn-technical user can quickly create databases, screen forms, and reports without programming by utilizing the built-in program generators.

Now for a limited time you can get your copy of IMS and save as much as $\$ 200$ ! The CoCo version is upgradable to the OS9/68000 version later with a 100\% credit!

## ORDER YOUR COPY NOW!!

programs which, he says, may help me. Your Australian reader advises me to use Art Gallery from Radio Shack to obtain large letters. I am impressed that the magazine is so widely distributed and I wish it every success.

Sidney B. Howie Carmel, New York

We're glad we could be of service, and thanks for the kind words.

## Printers and Hard Drives Editor:

What kind of serial-to-parallel printer interface would I need to connect my DMP133 printer to my CoCo 3? I am interested in purchasing one and do not know that much about the parallel interfaces. I understand that there are different sizes, but I would like to know what size to get. I am also interested in purchasing a hard drive for $m y$ CoCo 3 and I don't know how to purchase one. What do I need to have one and what comes with it? I understand it cuts down on having to use software all the time. I would like to know how one is used and what programs can be put on it. My $\operatorname{CoCo} 3$ has 128 K , but I have been thinking about going to 512 K . I would like to know whether or not it would be worth the money.

## Dwaine Acker P.O. Box 923 <br> Shelburne, nS BOT Iwo Canada

Microcom and Metric Industries, both advertisers, offer serial-to-parallel converters. Perhapsother vendors do, too. The "size" you mention must refer to an optional buffer. That is up to you. For information about hard drive systems for the CoCo, see "A Hard Drive for Your CoCo" (March 1989, Page 44).
the rainbow welcomes letters to the editor. Mail should be addressed to: Letters to Rainbow, The Falsoft Building, P.O. Box 385, Prospect, ky 40059. Letters sbould include the writer's full name and address. Letters may be edited for purposes of clarity or to conserve space.

Letters to the editor may also be sent to us through our Deiphi CoCo stg. From the CoCo SIG> prompt, type RAI to take you into the Rainbow Magazine Services area of the sIG. At the Rainbows prompt, type LET to reach the LETTERS> prompt and then select Letters for Publication. Be sure to include your complete name and address.
