# Data Transmission Reaches New Speeds <br> S everal years ago devices such as mo- <br> breed of modem becomes more popular, <br> that limits the speed at which data can be <br> with the transmission of data. Unfortunately, 

dems were considered to be expensive tools of magicians and those who practiced the art of computerized black magic. As time went by, the modem made slow gains in general use - while the speed at which data could be transferred increased from 300 to 1200 and finally to 2400 bits per second (roughly equivalent to 30,120 and 240 characters per second).

Chart 1: Average Throughput of File Transfer Protocols

In the past two to three years, modems have soared in popularity. Prices have dropped drastically, new online services have been created, most online services have decreased their hourly rates to maintain competitive edges, and BBSs operated mostly by hobbyists have sprung up like wildflowers.

What was once a market reserved for those who could afford it is now teeming with life due in part to the significant cost reduction in both the hardware and the services available. Not long ago bulky $300-$ bps modems cost well over $\$ 300$ and were acoüstically coupled to the telephone handset. Today the cost of a $2400-\mathrm{bps}$ modem is under $\$ 100,1200$-bps modems are available for as little as $\$ 20 \mathrm{new}$ - and the prices continue to decrease. And for the speed demon, 9600 -bps modems range in price from $\$ 400$ up while 14,400 -bps moderns are increasingly available. As this newer
expect the prices of the older-technology modems to fall.

## What Is a Modem?

A modem is a device that acts as a translator between a computer and the telephone system. Its main task is converting the computer's digital signals into the modulated analog signals used by the telephone system and visa versa for signals traveling from the telephone system to the computer. The key word here is modulation. Modulation of the digital signals is necessary because the telephone system is designed to carry the human voice, which generates sounds between 300 and 3000 Hz . The term modem is thus derived from the terms modulate and demodulate.

The modem plays a crucial role in getting data transferred from one computer to another. A poor-quality connection is typically the death of telecommunications even the sporadic crackle and pop can translate into an enormous amount of "garbage" appearing on the screen. Advances in modem technology coupled with advances in the telephone systems have helped bring about clearer connections with much less worry about noise interrupting our conversations.

Even with the technological advances of the last decade, it is the telephone system

Chart 2: Download Time in Minutes transmitted. This is because the intent of the telephone system is to transmit reliable voice communications from one location to the next. As modem technology advanced, better noise filters were developed that could effectively eliminate noise from interfering however, situations arise in which noise filters simply cannot totally eliminate noise. This led to the development of errorcorrection protocols.

## Feature Program

## The Wizard Puts a Hex on Checkers

The Wizard is a game that tests you ability to plan ahead. After you run this $\mathrm{CoCo} 1,2$ or 3 game, a checkers playing board appears onscreen. While The Wizard is played much like checkers, the object of the game is slightly different: You must keep the Wizard's men (your computerized opponents) from capturing your castle (the bottom two rows of the board).

The Wizard, whose men start at the top of the screen, moves first. When it is your turn, a small green dot appears on the screen. Use the right or left arrow to move the green dot so it is on the same square as the man you want to move, then press ENTER to select that man. Now press either the right or left arrow - the man will be moved diagonally to the right or left accordingly. When selecting a man to move, make sure the piece can legally be moved - no error checking is performed and you'll have to start the game
over if you select an unmovable piece. As with checkers, both players

move only diagonally and to open squares. However, you may jump over a Wizard's man, capturing that piece.

## A New World

This month's issue of THE RAINBOW marks a new era for our favorite CoCo publication (in fact, for the second-oldest continuously-published computer periodical we know of - Byte is older). As you have no doubt already noticed, we have changed our format from a "slick" stan-dard-sized magazine to a "tabloid" format. Interestingly, this marks the fourth time we have changed formats in our publishing history. And, as in every case in the past, there are pros and cons.

Originally conceived as a newsletter, the first RAINBOWs were printed on dotmatrix printers, photocopied, stapled in one comer, folded over and mailed. Of course we changed things many times from the initial issue in July 1981. But essentially that was the "look" THE RAINBOW had up until its first major change in January 1982 , when we went to "professional printing."

At that point we stapled a cover around what we considered had evolved into a magazine, used a heavier paper stock for the cover, and changed the way we did a lot of things inside. We still had dot-maxtrix copy; but during this period we added color, tried several different types of paper, and began using a different kind of printer - all of which made the actual composition of the magazine vastly different for us.

In July 1982, we went "slick" with the kind of four-color cover, shiny paper and typeset copy you are used to seeing. We thought it was a great step forward and many agreed; but many disagreed as well. We got quite a number of letters asking us not to use slick paper, asking us to continue to print editorial material on the cover, and so on.

Many changes came to THE RAINBOW during this time. We switched to perfect binding, started using four-color process for editorial and ended up with our own inhouse typesetting operation. The latter progressed into a full-fledged prepress setup which remains the heart of our production facilities today.

While all of this was happening, the Color Computer had its ups and downs (mostly ups) with the introduction of the Color Computer 2, DS-9 from Radio Shack, the CoCo 3 and lots and lots of other things. Then about two years ago Radio Shack discontinued manufacturing the Color Computer.

The CoCo still lives; and it lives happily. With millions of CoCos in the hands of people like you, the market for software and hardware continues to exist. And not a day has gone by in nine years that we have not gotten at least one new subscriber to THE RAINBOW.

No, the market is not as robust as in CoCo's heyday and never will be again. Yet I continue to maintain, along with thousands and thousands of people like you, that the CoCo is in many ways an ideal home computer (IBM and Tandy itself notwithstanding), and I believe it will continue to be for a long time to come. With no other system, at lower cost, do you see the ability, the speed, and the variety of opportunities and availabilities the Color Computer offers you.

As I am sure most of you who read this space have seen at one time or another,
magazine size is totally advertising-driven. This means that how much space we can use each month for editorial material is dependent on the amount of advertising space we sell.

This of course is why we always ask you to patronize our advertisers. As they do well, they advertise a little more, and we end up with more space for editorial use - more programs, hints, tips, columns and the like.

Also (of course) advertising is circula-tion-driven, which means that advertisers want their message to reach as many people for whom they have something to sell as possible. This is why we urge you to support us with your subscriptions, too, and to encourage others to subscribe.

When we were in a battle for survival with a number of other magazines in the CoCo market, we continued to grow and expand while the others fell by the wayside. The "rap" against THE RAINBOW that these other magazines always made was that they were "professional publishers" while we were sort of "hillbillies in Kentucky who don't know what they are doing."

But the "hillbillies" developed their own prepress operation rather than farming it out, did their own subscription fulfillment instead of hiring someone in Colorado, sold their own ads, and so on. We practiced economies that the publishing giants we were up against - Ziff-Davis and International Data Group - just could not do. And we do them still today.

We have been publishing THE RAINBOW at a loss for some time, primarily due to the expected declines in our advertising and subscription bases. We can still publish for a whole lot less than just about anyone, but now we need to make some changes; and THE RAINBOW you hold in your hands represents those changes.

What have we done with THE RAINBOW? Obviously we have gone to a tabloid format. And, agreed, it looks a little different. But we have also increased our editorial/advertising space by almost 9 percent simply by virtue of the increased size of the pages. This means you're getting more information in the issue you hold in your hands than you did from the one you got last month.

We bave increased the potential for edi-

## MS-DOS vs. OS-9

## Editor:

As a long-time CoCoer and CoCo loyalist, I must say that I've never seen the CoCo world in a more naive or idealistic state. In ads in this very publication, I see references to MS-DOS such as "works like the famous MS-DOS program."

I am a satisfied user of MS-DOS, various software packages, various hardware aspects, and even such obscure topics as advanced batch processing and assembly language. I make and sell PC-compatible computers and even own and operate three PC-compatibles. However, I have something to say that hopefully will open the eyes of many CoCo users who are ready to buy into the unrealistic MS-DOS ideal that exists in the CoCo world.

OS-9 is better than MS-DOS. It's as simple as that. While the two work almost exactly the same in most respects, OS-9 has more features - pound per pound, inch by inch. OS-9 beats MS-DOS in speed (see how fast MS-DOS runs on a $2-\mathrm{MHz}$ machine), capability (MS-DOS is not modular), and just about any other aspect you can think of
torial color by using what is called spot color as opposed to costly four-color process color in the majority of the magazine (but the cover page remains four-color). If we want the printer to print red, we tell him to "print red here" and he loads up his press with red ink. With the four-color process, he has to "make" red by combining two different inks; and we have to have them available on every page on which we want to put red.

We are giving our advertisers more space to showcase their products at no increase in cost; simply put, the ads are bigger as the page size increases. This also means we can offer some less-expensive "beginner" advertisments for people with new programs and new ideas. If such products are successful, our revenue grows. And the number of pages will then grow, too.

Needless to say, the changes we are making result in savings (obviously!) in the cost of paper and printing. We are directing these savings into editorial support for the magazine.

Speaking of editorial support, we will begin leaning more and more toward fundamentals: the basic Color Computer and OS-9. We felt the new computers, which we featured on three covers last year, deserved your consideration. But the vast majority of CoCo users want information about their $\operatorname{CoCos}$. That's what we will do.

In "Fiddler on the Roof," when Tevya the Milkman was trying to convince Golda it was all right for their daughter, Seitel, to marry Motel the Tailor just because she loved him, he told her: "It's a new world, Golda." Within a year or so, Motel bought a new invention (a sewing machine); Seitel was expecting Tevya's first grandchild; and though there were travails, the family ended up moving from an "overworked, tumbledown village" in heartless Russia to Chicago. And there they lived happily ever after.

It's a new world at the rainbow, too. I think with these changes - and your support - we of the CoCo Community, like Tevya, will live happily ever after.

- Lonnie Falk

Many CoCoers hope to escape the drudgery of learning OS-9 by moving to MSDOS. For those of you thinking of taking this route - it's not possible. Disk BASIC is the last of the orphan BASIC operating systems. OS-9 and MS-DOS are in the same category - and they function almost alike (from the simplest dir command all the way to batch processing, full pathnames and redirection symbols.

CoCoers, wake up and smell the roses that exist right under your nose . . . and use OS-9.

## And Again ...

Editor:
I am writing this letter to thank you for what you are doing for CoCo buffs. My brother-in-law has an 80386-based system and he has it loaded to the hilt with programs. I have Turbo C and Turbo Pascal by Borland, which I use, but my true love is my CoCo.

I do not have a hard drive for my CoCo ; and since I am out of work, I can't afford Delphi, although I wish I could. I even wish I could afford a bigger and better CoCo. I think most CoCo buffs really do prefer CoCos over PC-compatibles. And just think, if CoCo buffs worldwide sold to each other, we all would be doing better.

It is good to see what else is available in computers for us. But before we buy, we may want a system that is going to be backed up by a magazine. Perhaps you should decide what would be best for the CoCo community as a future computer, so the CoCo community can develop software for it. Then, if we want a multi-user network, we could do it on our own. We CoCo buffs could eventually set up our own computer network and go from there.

The future is here, so don't give up the ship.
J. Lee Smith 1050 State Street Vermilion, OH 44089

While we can publish information for just about any system we choose, the CoCo Community has been established for some time. It would be suicide to pick just one of the new machines, cutting off support for the others and the CoCo (which is the reason we are here in the first place). We cannot decide what is best; onty you can do that. The software will follow. And we are here to support the community in the direc tions it takes.

## Transferring Files

Editor:
Since I started using the CoCo, I have been purchasing back issues of THE RAINBOW as 1 could afford them. I would like to recommend two issues (June and July 1986) to all those who are thinking of changing to a "better" machine. These two issues contain articles for transferring ASCII files to MS-DOS and back again. I have used the programs both ways between my CoCoand a friend's IBM machine. It sure saves a lot of typing if you are sending already stored files, or if you are transferring your own files to your PC.

A lot of people are impressed that our little machine can do this.

## Editor:

Is there any possible way we can use our CoCo 3 disks in a PC-compatible computer? We want to keep our CoCo, but we also have a Headstart Explorer that we would like to transfer our CoCo 3 disks to. Any chance of doing this?

Susan Stutzman

Several file-transfer utilities are available from a number of sources. GCS File Transfer Utilities from Granite Computer Systems (603-464-3850) runs under OS-9 and can transfer files between OS-9, MSDOS, Disk BASIC and Flex operating systems. Elite*Xfer, available from Elite Software (800-745-8491), runs under MSDOS and transfers files between MS-DOS and Disk BASIC, and can also translate Elite*Word files to ASCII format.

## Black-and-White Colors

Editor:
My sister and I both have CoCo 3 's with CM-8 monitors, and we are not sure if we are having a problem or not. With the PALETTE RGB command, some of our software (for instance, DeskMate) comes up in black and white on the monitor and in color when connected to a TV. What is going on?

I would like to thank the people at Zebra Systems for their help. My sister bought CoCo Graphics Designer Plus and there wasn't a setting for her DMP-107 printer.

We wrote to Zebra Systems and a week later came the answer to use the DMP-130 setting.

Frank Barry

Pre-CoCo 3 software often took advantage of a problem with TVs and color composite monitors that allowed them to display artifact (false) colors. The effect of color was achieved by drawing black lines in certain screen locations. Being more precise, the CM- 8 and other $R G B$ monitors display the information exactly as it is sent -in black and white. This is not a problem with your monitor or the software.

## Amateur Radio Software

## Editor:

Ijustreceived six sides of public domain amateur radio software from radio operator Dave Johnstone (WB1COB) on the condition that I spread it around to hams everywhere. He says it's from the American Radio Relay League's old PX department listings that were available to anyone with the time to enter the listings. All the classics are included.

You are always printing letters from hams looking for software for our versatile computer. Any ham who sends me enough disks and a self-addressed, stamped disk mailer is welcome to this software.

## Compiler References

Editor:
I have been a subscriber to THE RAIN Bow for about two years and I have found a lot of useful information in the articles. I have recently been able to purchase the Pascal and C compilers and the OS-9 Development System at a very reasonable price. Can you recommend or do you have any reference manuals for these?

I am purchasing the Complete Rainbow Guide to OS-9. I am currently using OS-9 Level II. Can you recommend any other reference material for this system and where I may be able to obtain it?

Samuel W. McGregor
4213 Trough Springs Road Adams, IN 37010

The C compiler for OS-9 follows the older Kernighan and Ritchie standard, so any book based on that standard will help you learn how to program in C. The primary reference for the C language is The C Programming Language, First Edition by Kernighan and Ritchie. This book was updated a few years ago and The C Programming Language, Second Edition covers the newer ANSI standard.

## Installing Additional Drives

## Editor:

I have a technical question that I can't seem to get answered from my Radio Shack dealer or local CoCoists. I obtained a TRS80 Mini Drive (Catalog No. 26-1160) in the old gray case and want to see if I can dismantle it and use the drive as Drive 1 in my FD-502. Car I do this? Although the older drive has the lock in the middle and the FD-502 has a lever lock, I believe the old drive will mount in the case perfectly.
Where can I purchase reversible $51 / 4$-inch disks? I can't find a supplier. Also 1 read quite a bit about BBSs. In the near future I plan to add a modem, but for the time being is it possible to get some of the freeware offered on BBSs for my use now?
Thank you for any help you can give
and keep up the excellent work with THE RAINBOW. Without it I'd be lost, and I'm sure other CoCo Nuts would say the same thing.

Dann McConnell 613 West Park Kellogg, ID 83837

You should be able to use the drive with your CoCo system. See "Disk Drives and the CoCo" in the March and April 1990 issues of THE RAINBOW for more information.You can getreversible ("flippy") disks from BASF Corporation Information Systems (Crosby Drive, Bedford, MA $01730-$ 1471); ask for Part \#54337.

## In Search of Compilers

Editor:
I have had a CoCo since December 1982. I am looking for a C compiler for Disk basic. I have a C and Pascal compiler for OS-9, but I need the stand-alone ability with Disk BASIC. I am currently using Deft Pascal Version 4.1, but I need something more flexible.
Does anybody know of a C compiler for Disk BASIC? Years ago there was one sold by Duggers Growing Systems and I've heard rumors of a Small C port, but I haven't been able to find either one.
And does anyone know where I could obtain information on the internal workings of OS-9 Level II?

Carey Bloodworth
1601 North Hills Boulevard Van Bure, AR 72956

Frank Hogg Laboratory used to sell a book titled Inside OS-9 Level II written by Kevin Darling that covers the inner workings of OS-9 Level II. Although FHL is no longer selling this book, we have heard that

CoCoPRO! may start selling it in the near future.

Feature Program

If you work wordsearch puzzles often, you no doubt have come across puzzles that are very difficult to solve some words just seem to want to stay hidden. I wrote WordFind to end the frustration of hourlong searches. WordFind is a CoCo 3 program that can find words in puzzles with up to 21 lines and 70 characters in each line. Of course it's cheating, but preventing a headache is sometimes more important.

To use WordFind, enter the program as shown in the listing and save it to disk or tape. (The program uses the high-speed poke so be sure to enter it completely and save it before running it.) Before running the program, you must enter the puzzle you want WordFind to search. Do this by editing and adding DATA statements in lines 30 though 99. Each line in the word-search puzzle is represented by one data itern, and all the characters in the line are entered

without spaces between them. All lines should be entered using uppercase characters. Since WordFind comes with a sample word puzzle, you can look at Line 30 to see how it is done. Be careful when entering the lines - if you make a typing mistake, WordFind may not be able to find the words for you.

After you have entered the puzzle, run the program and you are greeted by a title screen. When the screen clears, WordFind tells you how many lines are in the puzzle. When you press a key, the program prompts you to enter the word you want it to find. WordFind then goes to work, searching through the puzzle for your word. (Larger
puzzles may take some time, so please be patient.)

If the computer doesn't find the word you want, it tells you. If the computer does find the word, it changes the word to lowercase characters and flashes it onscreen in the correct position in the puzzle. At this point, press any key to return and enter another word, or press BREAK to exit the program.

Brad Renfro has won regional awards for programming as a member of his school's computer team. He has been programmingfor seven years and is now learning assembly language and Pascal.

When writing a program that others will use, it is important to design the program (where possible) so it knows whether the other systems are tape-based or use a disk drive. In BASIC, you can use PEEK (188) to get this information. If the value returned is 6 , the system is tape-based. But if the value returned is 14 , a disk drive has been detected. Your program can then proceed accordingly.

# Modification Allows Y Cables 

Many CoCo users express an interest lines. The Multi-Pak solves a lot of probin using multiple devices with the cartidge port. Because it is so difficult to locate a Multi-Pak Interface, most of these people consider using a Y cable. However, addressing conflicts often stand in the way of using, for example, a Tandy disk controller and a Burke \& Burke hard-drive interface on the same cable.

This article describes an extremely simple hardware modification to Tandy disk controllers, allowing them to be used with the Buike \& Burke hard-drive interface or other devices on a Y cable. The modification may he useful to those who want to repackige their CoCos in PC cases (the Multi-Pak isn't easily reduced in size) and also to owners of the TC9 from Frank Hogg Laboratories, which uses a Y cable.

## Technical Information

Tandy included two special lines in the Color Computer's system bus to make it easy to connect external hardware to the system: the *CTS and the *SCS lines. The *CTS line (Pin 32 on the system bus) is the cartridge-select, which becomes active when the CoCo is operating in the ROM mode and is trying to read from a location in the address range $\$ 0000$ through SFEFF. The *CTS line is commonly used to decode disk-controller and game-cartridge ROMs. The presence of this line allows programmers to create cartridges that use only a ROM, without any extra address-decoding circuitry.
The *SCS line (Pin 36), or spare cartridge select, becomes active during any attempt to read from or write to an address in the range $\$$ FF40 through $\$$ FF5F. The asterisk in front of *CTS and *SCS means that these lines are active-fow - each line performs its function when the signal on it is Low. In some literature a bar over the name of the line is used to indicate it is active-low.

I doubt Tandy originally envisioned the Color Computer as a machine with several special-purpose hardware devices plugged in - the computer is designed to accept only one cartridge at a time. This attitude carried over to the design of the Color Computer floppy-disk controller: While the disk controller uses only the address space from $\$$ FF40 through $\$ F F 4 F$ to operate, Tandy did not design it to fully decode the *SCS address space. This leads to address ghosting from the $\$$ FF50-SFF5F tange to the $\$ F F 40-\$ F F 4 F$ range - when using a Tandy or compatible disk controller, anything written to address \$FF5 $x$ also appears at address \$FF4r. Some external hardware devices are designed to use addresses between $\$ F F 50$ and SFF5F, but they clobber the disk controller when writing data to this range. Herein lies the problem.

To meet the demand for more-complex Color Compuler selups, Tandy introduced the Multi-Pak Interface. This device allows expansion of the system in several ways: It buffers the address and data lines, provides extra power for add-on cards. and allows you to switch between up to four diflerent devices that use the same *CTS and *SCS
lems . . . if you can find one.

## Burke \& Burke and Y Cables

The current model of the Burke \& Burke hard-drive interface uses the *SCS line to decode the address space from \$FF50 through \$FF5F for I/O. This model (unlike some of the very early production models) also fully decodes the *SCS line so that it does not overlap or ghost into the $\$ F F 40$ through $\$ F F 4 F$ range. If the lioppy-disk controller for the CoCo was fully deceded for the $\$$ FF40- $\$$ FF 4 F iddress ringe, it could be used on a Y cable with the Burke \& Burke interface. eliminating the need for at Multi-Pak or similar device fe.g.. the Howard Medical Slot Pak III). This wouht be a boon to TC9 owners, those who can't find a Multi-Pak interface, and those who want to repackage their CoCos in different cases. (Though I use the Burke \& Burke hard-drive interface as an example, other devices could compete with the Tandy disk controller for the *SCS space if used together on a X cable. For more information about the $\mathrm{CoCo}^{\circ}$ s nemory map and using add-on hardware devices. see "CoCo Consultations" on Page 94 of the February 1991 issue of the rainbow.)
If you decide to use a $Y$ cable, some precautions are in order. To prevent intermittent disk failures, you should use as short a cable as possible, preferably no longer than a few inches. Also remember that the power supply in the Color Computer is not designed to supply power for much extra hardware. Nor do the CoCo 2 and CoCo 3 supply 12 volts on Pin 2 of the system bus. You'll need to find a way of providing adequate externat power on the 5 - and 12-volt lines of the Y cable. (The Burke \& Burke interface requires 12 volts on Pin 2.)

The *SCS Modification
It is a simple procedure to modify a floppy-disk controller to narrow down part of the *SCS address space that it uses. The aproach we'll take is to interecpt the *SCS signal before it enters the controller circuitry, then use a single logic gate (part of a 74L S32) to OR it with the A4 address line. The output of this OR gate is sent to the controller where the unmodified *SCS line was previously attached.

The 74LS 32 chip is a quad OR gatc; though it contains four gates, you will use only one. The inputs to the three unused gates should be tied High. The easiest way to install the chip is to bend all of its pins to the horizontal, exceptpins 7 and 14 (ground and +5 volts), then "piggyback" the chip on top of any other 14 -pin 74 -series chip already in the disk controller. Make sure the chip is oriented correctly, and solder pins 7 and 14 to pins 7 and 14 of the chip underneath. This provides a solid mechanical mount for the chip and supplies power to it. To tie the unused inputs High, connect pias 4,5,9,10. 12 and 13 of the 74LS32 together and also to Pin 14. Pins 6.8 and 11 (the unused outputs) may be left unconnected. Now locate Pin 36 on the disk control-

Mertztown, PA 19539
ler＇s 40－pin card－edge comnector．This is the＊SCS pin．Using a Dremel tool or Ex－ acto knife，cut the circuit trace that connects to Pin 36 just beyond the wide portion of the 40 －pin connector．Carefully use a soldering iron to attachone end of a jumper wire to the wide part of Pin 36 （the part of the 40－pin connector that is now unconnected）．Con－ nect the other end of the jumper to Pin 1 of the 74LS32 chip．

Determine where the trace that previ－ ously went to Pin 36 （the＊SCS line）goes on the disk controller．Solder a wire to that point．Connect the other end of the wire to Pin 3 of the 74LS 32 chip．

Now locate Pin 23 on the 40 －pin card－ edge connector．This is the A4 address line． Solder a wire to $\operatorname{Pin} 23$（be careful not to glop solder over the part of the pad that fits in the edge connector）and connect the other end of the wire to Pin 2 of the 74LS32，

Examine the top and bottom of the disk－ controller circuit board before cutting any traces．Make sure that where you plan to cut the trace will completely interrupt all traces connected to the＊SCS pin．At the same time，make sure all traces that connect to the ＊SCS pin remain connected together，while separated from the＊SCS pin．The＊SCS line is used for the Chip Select on the disk－ controller chip and as an Enable for the 74LS273 chip that constitutes the register at \＄FF40．Be sure both of these points are connected to the output（Pin 3）of the 74LS32 after you complete the modification．

If all has gone well，you＇ve modified the ＊SCS decoding circuitry in the disk con－ troller so that it responds only to addresses in the range $\$ F F 40$ through \＄FF4F，and so it no longer ghosts the \＄FF50 through SFF5F range．To test your work，first set up the system with the disk controller in place． Then at the Disk Extended BASIC prompt， enter POKE \＆HFF40．1．The drive－select light
for Drive 0 should come on．Enter POKE \＆HFF40，0 to turn the drive－select light off． Now enter POKE \＆HFF50，1．On unmodified controllers，this poke also turns on the drive－ select light for Drive 0 ．But if you per－ formed this modification correctly，POKE \＆HFF50，1 will have no effect on Drive 0＇s drive－select light．

## Disto Controllers

The Disto Mini Controller，a short card， needs the modification described here be－ fore it will work together with a Burke \＆ Burke interface on a Y cable．However，
some of the more－complex Disto control－ lers present a special problem．They com－ pletely decode the＊SCS line in the \＄FF40－ \＄FF4F range for the floppy controller，but they also decode the \＄FF50－SFF5F range for their internal mini bus（which is used to support serial and parallel ports and a clock）． Even when this space is not being used by a Disto plug－in mini－bus card，it is still present on the system and can conflict with other devicet．If you own a Disto Super Controller，you must use it with a Multi－ Pak or Slot Pak III if you want to preserve the function of the internal mini bus．If you
want to use the controller on a Y cable with a Burke \＆Burke interface，you must per－ form the modification described above， which renders the mini bus inoperative．

tory track（Track 17），it is important that you be careful to enter the listings exactly as shown．When you first try the Autoboot system，use a test disk to make sure it works properly．This is especially important if you have made any alterations to the program．

Before you get started，you must build a m：achine－language program．To do this，run SOOTDATA，which creates the machine－lan－ guage program BOOT2．BIN and saves it to disk．After this，you are ready to set up your own DOS－bootable BASIC programs．
Put the disk with AUTOBOOT and BOOT2．BIN in Drive 0 and enter RUN＂AUTOBOOLF ．．You＇d be asked to insert the disk on which yourwant to install the auto－boor function．Then the program prompts you separately for the filename and extensioth of the BASIC prograng you want DOS to boot．Remember，Autoboot works only with BASIC programs；it cannot
be used to set up a DOS boot for machine－ language programs．

After a few seconds，the program fin－ ishes modifying the disk．At this point you can either add the function to another disk or quit．Once you are finished，you can boot the BASIC program on the modified disk simply by entering DOS．

If you try to use Autoboot on a disk that is too full，the program will let you know． Just copy the BASIC program to a fresh disk and run Autoboot again．

## GRAE

GrafExpress 20 is a complete graphics and music programming environment. From the beginner to the accomplished protessional you can use GratExpress to create lightning fast arcade games, graphic applications and utitities, and w ndowing muitimedia demonstratons! The GratExpress package includes two incredible systems GrafExpress 16 works on all monitor lypes and offars support in 12 graphic resolutions (from $128 \times 192$ to $320 \times 225$ ) Grafexpress 256 of fers 6 resoutions (from $128 \times 192$ to $160 \times 225$ on a composite monitor) n an astounding 256 colors! Ever see a CoCo do that before? Both systems include standard graphics commands (CIRCLE. FILL, etc.)
that blow away the competition. For example, the BOX command peaks out at over 2 MegaPixels/second; that's 300 times faster than BASIC! 255 separate sprites of up to $100 x 100$ pixets bach are supported with window clipping and high-res pixel level collision checking. The 8 -octave/ 4 -voice music synthesizer has indapendent envelope, waveform, and volume controls, a $7+K \mathrm{KHz}$ sampling rate, and much more. Other features include text/graphics mixing, diflerent font sizes, fast window copying and scrolling, picture save/load, easy implementation from both BASIC and assembly languags, muttiple screen animation, and support for $128 \mathrm{~K} / 512 \mathrm{~K}$, double speed, and the high-res joystick interface. The package also contains support programs that are worth the purchase price of GrafExpress alone! These include an introductory demo, a picture editor, a wavelorm editor, and an art program that supports 256 colors! Grafexpress also comes with a 50 page manual that fully expatins all of its incrediüt teatures, you do any graphics programming or simply want to see what your little CoCo is capable of, Gratexpress is a must! ## KBCom: A Versatile OS-9 Terminal Program

It seems that for many Color Computer users the No. 1 priority is to communicate; over the last 10 years there have been several different telecommunications programs - some good and some bad. I recently had the pleasure of reviewing a good one, KBCom, written by Edward W. Kuns and distributed by Kala Software.

To run KBCom, you need a CoCo with at least 256 K of memory, OS-9 Level II, an RS-232 Pak or equivalent, and a modem ( 300,1200 or 2400 bps ). $K B C$ Com comes with its own installation program, making it easy to get started. The program is designed for plug-and-run operation, so you'll be able to get online right away. For Multi-Vue users, the package also includes an icon and an AIF.

KBCom is menu-driven and uses pop-up windows to guide you. However, as you gain experience you'll quickly switch to using the built-in "hot keys" to select special features. Another feature advanced
users will find helpful is KBCom's suppert for macros and scripts, which can be used for automation of such functions as downloading of messages and logging on to a host computer. Additionally, user-defined configuration files allow you to tailor KBCom for just about any type of system.

File-transfers via X - and Ymodem, as well as Kermit and ASCII, are supported. However, these capabilities are not built into KBCom itself; they are provided through external, stand-alone programs that can also be run from within KBCom. An advantage to this approach is that you can use the external programs to transfer files without running $K B C o m$. I use them along with OS-9's timesharing monitor, TSM on, to transport files to and from my PC. Those who don't want to use TSMon may be inter-
ested in using KBCom's built-in Host mode, which is easy to set up.
In addition to providing support for VT100, VT52, ANSI, OS-9 and CRT emulations, $K B C O m$ can be run in either a text or a graphics window. If you use a graphics window, special fonts are provided for the terminal emulations noted above. This is very important - I encountered problems using VT100emulation in a text window when I tried connecting to an SCO XENIX (UNIX) system. Because of the limitations of the OS-9 text-screen character set, certain characters (such as lines and boxes) appeared as alphabetic letters. When I switched to a graphics screen and reconnected, the screen looked just like it should. This has generally been my acid test, and KBCom scored high marks.

The only other problem I encountered was in the use of $v i$, a full-screen editor for XENIX. No matter what I ried, I could use only about three-fourths of the screen for the editor. However, the editor did function properly.

Rounding out KBCom's features are a built-in timer and logging functions for keeping track of a session, a conference mode, and the ability to send the output of OS-9 commands through the modem. If find all of these features are necessary in a welldesigned communications program. (Kala Software, 3801 Brown Bark Drive, Greensboro, NC 27410, 919-294-1558; \$44.95.)

## MLBASIC 2.0 - BASIC Compiler

If you want your BASIC programs to run up to 50 times faster, or want more programming features without learning another language, MLBASIC is for you. MLBASIC is the most compatible BASIC compiler available for the Color Computer WHY? Because MLBASIC fully supports:
o All available commands offered with normal BASIC, plus more o All types of 1/O (disk,screen,printer,RS232), plus machine level commands o Full floating point arithmetic (same as notmal BASIC)
o All normal BASIC variable types PLUS INTEGER (16 bit) type

- Use of all available RAM and graphic modes in the COCO 3

MLBASIC not only contains everything that you would expect a BASIC programming language should contain, MLBASIC has features that offer flexibility of other languages like C, Pascal, FORTRAN and even assembly language. These features will allow programmers to directly access the CPU registers on the COCO , produce modular program code with SUBROUTINES, manipulate memory in blocks, and even call ROM routines in other areas of memory.
MLBASIC allows for the first time user to quickly compile a program using default compilet settings. The advanced user has the capability of controlling over a dozen settings which control where the program is compiled, which medium to compile to (memory or disk), string space, compiler listings and more.
"MLBASIC is a fine program for any serious programmer" said David Gerald in the December 1987 RAINBOW.

With all this going for MLBASIC, you might expect the cost to be a little out of your budget. The normal price is only $\$ \$ 9.95$, and if you buy MLBASIC ncw, you will save $\$ 10$. But don't hesitate, you can have a programming language that will spark your interest in your Color Computer once again.

Optimize Utility Set 1; Optimize your disks by ellminating fragmented files and compacting your directories for faster flle access. Running time averages one hour. Also includes a utility to assess file fragmentation and directory fragmentation as well as excess directory padding. Can work in conjunction with Burke \& Burke's repack utlity. Look for upcoming rewew in Rainhow. \$29.95; Foreign Pontage, add $\$ 3.00$
Optimize Utility Set 2; Contains two programs to check the Integrily of your disks. Detect and correct any directory or file structure errors. Run periodically and before any optimmations to insure the rellability of your data. Look for upcom ing review in Rainbow. \$19.95; Foreign Postage, ndd \$3.00
Optimize Utility Set Pac: Combination of both optimize sets. Purchasers of the Optimize Uttlity Set $I$ can upgrade for $\$ 9.95$ with proof of purchase. $\$ \mathbf{8 9 . 9 6}$; Foreign Postage, add \$4.00
Nine-Times; Each issue contains: 9 helpful and useful programs to help build your OS-9 library • Instructions, examples, and samples of Basic09 procedures and subroutines to help with your own programs and your understanding of Basic09 - C programs and programming examples • Hints, Help columns, and informative articles to advance your knowledge of OS-9 : Supplied totally of 5.25" disk - Bound manual sent to each new subscrrber for help in getting Nine-Times up and running, as well as tips on using it with a ram disk or hard disk - All graphic/Joystick interface for ease of use. # How to build a high-paying career, even a business of your own, in computer programming. 

RICK BRUSH, NRI Programmer/Analyst

Start with training that gives you hands-on programming experience - at home and at your own pace. Training that begins with BASIC, then continues with Pascal, $C$, and COBOL — today's hottest computer languages. Training that now includes a powerful $3865 \times / 20 \mathrm{MHz}$ mini-tower computer, modem, and programming software you keep.

Start with real-world training. The kind of training only NRI provides.

Now, with NRI's innovative at-home training in Computer Programming, you can learn to create full-featured, powerful programs to carry out an astonishing range of business, professional, and personal applications. Now, with NRI, you can be a computer programmer, ready to build a highpaying career - even a business of your own - making computers do anything you want them to do.
invaluable programming software - BASIC, Pascal, C, and COBOL - all yours to keep.

You get the experience and the know-how, the computer and the software to get to the heart of every programming problem, design imaginative solutions, then use your choice of four key computer languages to build original, working programs.
No matter what your background, NRI gives you everything you need to succeed in programming, today's top-growth computer career field.
You need no previous experience to build a successful programming career with NRI training. Indeed, your NRI lessons start by walking you step by step through the fundamentals, giving you a solid understanding of the programming design techniques used
debug, and document programs in BASIC, Pascal, C, and COBOL. Then, rounding out your training, you use your modem to "talk" to your instructor, meet other NRI students, even download programs through NRI's exclusive programmers network, PRONET.

Your career in computer programming begins with your FREE catalog from NRI. For all the details about NRI's at-home training in Computer Programming, send the coupon today. Soon you'll receive NRI's fascinating, informationpacked, full-color catalog.

Open it up and you'll find vivid descriptions of every aspect of your NRI training. You'll see the 386 sx -based computer included in your course up close in a special poster-sized foldout section. Best of all, you'll find out how your NRI training will make it easy for you to build that high-paying career even that business of your own - in computer programming.

You master today's hottest computer languages, gaining the skills you need to build programs for a wide variety of real-world applications.
every day by successful micro and mainframe programmers. And then the fun really begins.

With your personal NRI instructor on call and ready to help, you use your computer and software to actually design, code, run,

> Get hands-on training with an AT-compatible, 386sx computer system and software you keep.

Unlike any other school, NRI gives you hands-on programming experience with a powerful 386sx/ 20 MHZ mini-tower computer system, including 2400 baud internal modem, a full megabyte of RAM, disk drive, monitor, and

D0 you remember the recipe filer pro－ gram that appeared in the April 1988 issue of the rainbow（Page 28）？While it did allow me to get rid of all those greasy 3－ by -5 index cards．I found the program a little confusing．So I rewrote the original program，made it easier to use，and altered it to take advantage of the CoCo 3＇s 80－ column text screen．With Recipe Filer $1 /$ ． you get a better view of the recipe onscreen． and you can edit it much like you edit with a word processor．

In addition to allowing＂full－screen＂ editing．Recipe Filer $/ l$ offers the following options：save，load，kill，clear and print．To invoke one of these commands，just hold the CTRL key and press the first letter of the command you want．

The Save and Load functions are self－ explanatory，though it is important to re－ member that Recipe Filer／l saves a recipe asa single file．Also．if you used the original and have recipe files stored away，Recipe Filer／l call read them．The Kill option is used to delete a recipe file from the disk． and the Clear option erases the recipe cur－ rently in the editing buffer．The Print com－ mand causes Recipe Filer II to print a hardcopy of your recipe in 3－by－5 format； the program uses the same printout format as the original program．

To use the program．enter it as shown in the listing．save it to disk and run it．I hope Recipe Filer $I I$ helps climinate the confu－ sion and gives you a handy way to store all your recipes．

Wizard continued from Page 1

To do so，there must be an open square diagonally behind the piece．Be careful： The Wizard can jump your pieces，too，and it is a challenge to beat him．Unlike check ers，multiple jumps are not allowed．Play continues until the Wizard moves a man into your castle or you eliminate all his men from the board．If the game is a draw，the Wizard is awarded a win．

To get The Wizard running，enter the program and save it to tape or disk．Then enter RUN and press any key after the title screen appears．Since the game uses PMODE 3 colors，CoCo 3 owners who use RGB monitors may want to enter RG8 before running the game．Also，The Wizard uses the high－speed poke in Line 10．You can change this to POKE 65497.0 for the CoCo 3．Remember：Never save a program to tape or disk while the computer is in the high－ speed mode．Make sure you enter PDKE 65494.0 （POKE 65496，0 for the CoCo 3 ） first．

Kevin Gattis attends Nash Community College and plans to transfer to North Carolina State and major in computer sci ence．He enjoys playing basketball as well as computer games．Kevin may be con－ tacted at Rt．I，Box 460 ，Wilson，NC 27893 （919）243－422I

## Error-Correction Protocols

The MNP and V. 42 error-correction protocols achieve error-free transfers by detecting differences between transmitted and received data. (Actually this implies the receiver already knows what it is supposed to receive. If that were true, we wouldn't need to send the data in the first place.) What actually happens is relatively simple.

MNP Level 1 operates much the Xmodem file-transfer protocol. In this method data is assembled into packets, and an error-check value is computed and appended to the data. The packet is then transmitted across the phone lines to the receiving modem. The receiver computes an error-check value as it receives the packet and compares the error-check value it created to the one stored in the received packet. If the two values match, the receiver sends a positive acknowledgment to the transmitter. If the two values do not match, the receiver sends a negative acknowledgment and the transmitter sends the packet again. The disadvantage of MNP Level 1 is that it is a half-duplex protocol - in other words, data is transmitted in one direction at a time in a manner similar to that of CB radio.

MNP Level 2 enhances the efficiency of

MNP Level 1 by allowing data to be transmitted in both directions simultaneously. Even with this enhancement, data throughput is reduced to approximately 84 percent compared to that of a non-MNP connection. This effectively means that a \(2400-\mathrm{bps}\) connection using MNP Level 2 transmits data at approximately 2016 bps.

MNP Level 3 further enhances the efficiency of data throughput by transmitting the data in synchronous packets - that is, it strips the start and stop bits from the transmitted data. Considering that one start bit and one stop bit are transmitted with

Chart 3: Effect of Data Compression on Throughput
every eight bits of data, this effectively increases the efficiency of data throughput by 20 percent and, coupled with other minor enhancements, yields a theoretical throughput of 108 percent compared to a non-MNP connection. Theoretically, then, data throughput of a 2400 -bps connection is increased to 2592 bps.

Further, MNP Level 4 reduces the protocol overhead of MNP Level 3 by decreasing the amount of "control"' information appearing in each packet and increasing the amount of data transmitted in each packet, thereby yielding a theoretical 5-percent increase in data throughput over that of MNP Level 3

Of course theories don't always predict real-world events, and these comparisons in data throughput are given to compare the advances made in the various error-correction protocols and should be taken with a grain of salt, so to speak. The single most important reason for purchasing a modem with an error-correction protocol is to obtain entor-free connections - not to "boost" data throughput.
V.42, the international standard for er-ror-correction protocols, includes an alternative protocol that is compatible with MNP. Although MNP Levels 3 and 4 operate quite well, V. 42 is better suited to detecting and recovering from errors. It uses a 32 -bit CRC instead of the 16 -bit CRC used by MNP. Indeed, one particular advantage of V. 42 is that it is an intemational standard whereas MNP is a proprietary protocol. We have also discovered that many manufacturers are discontinuing - if they have not already discontinued - MNP modems in favor of V. 42 .

\section*{Data-Compression Protoculs}

Once an error-free connection is established, the next step is to increase the amount of data transmitted over a given period of time. One such tactic is the use of datacompression protocols in modems such as the MNP Level 5 and V.42bis. This is almost identical to the use of an archiving program like Ar except that it is performed by the modem and is completely transparent to the computers on either end of the connection. In a typical scenario, the computer sends data to the modem as it normally would. The modem then compresses the data and sends it across the phone lines. The modem on the other end decompresses the data as it is received and sends the decompressed data to the receiving computer.

Using Run-Length Encoding (RLE), MNP Level 5 achieves a theoretical compression ratio of 2 : 1 , while V . 42 bis uses the Lempel-Ziv-Welch (LZW) method of data

Chart 4: Effect of Data Compression on Download Time
compression and achieves a theoretical 4:1 compression ratio. ASCII text files typically show the most significant increase in throughput, while files that are already compressed (such as with Ar) evidence as little as 60 percent of the throughput found for an ASCII file.

One of MNP Level 5's drawbacks is that it attempts to compress everything it receives - including data that has already been compressed. This can result in the modem's sending more data than is actually contained in the file to be transferred V. 42 bis automatically disables itself temporarily if it determines that it cannot compress the data being received from the computer.

\section*{Dual Speed}

The use of data-compression protocols inherently means that a \(2400-\mathrm{bps}\) modem transmits data faster than 2400 bps . For example, a 2400 -bps modem with MNP Level 5 can transmit data at up to 4800 bps ; the same modem with V.42bis can transmit data at up to 9600 bps. Assume for a moment that you are using a \(2400-\mathrm{bps}\) modem equipped with the V. 42 bis data-compression protocol. Also assume that you are using with that modem a terminal program set at 2400 bps . Even though the modern is receiving the data at 2400 bps - and assuming the data is receiving optimum compression - very little if any speed is gained, because of the delays between each character received by the modem.

Think about this for a moment. Because you are sending data to the modem at 2400 bps, the modem is receiving data at 2400

Chart 5: Estimated Throughput of Zoom Turbo
bps . This means the same amount of data is being transferred between the computer and the modem within the same amount of time. And yes, the modem is sending data across the phone lines at up to four time faster than normal. However, no activity occurs on the phone line between each character received by the modem. This means that up to four times the amount of data is being transmitted in a given amount of time but also that the phone line is inactive for one-quarter of the time - effectively yielding no speed increase.

To achieve optimum performance, data must be sent to the modem as fast as the modem can accept it. For MNP Level 5 this means data should be sent to the modem twice as fast (at 4800 bps ) because of its theoretical \(2: 1\) compression ratio. For V.42bis it means data should be sent to the modem four times as fast (at 9600 bps ) because of its theoretical 4:1 compression ratio.

But what if you are using a \(2400-\mathrm{bps}\) modem equipped with V. 42 bis and sending a compressed file to the modem at 9600 bps? Obviously it wouldn'ttake very much time for the computer to get ahead of the modem, because the computer is sending data to the modem faster than the modem can handle it. This would result in catastrophic data loss. Obviously we aren't smart enough to know how well the modem can compress data, and therefore we don't know how fast to send data to the modern. Even worse, each block may receive more or less compression than the next block, meaning that we'd have to use some type of

\footnotetext{

While you often hear people talk of not he correct term for measuring ifs, the sherd of a modem measured by its Waud tate (300, 1290, 2400 or 96001 ), technically this is not the correct term. The speed at whichamodem perfornis its task, that of transfering date is actually measured in bits per secend (bps).

Baud is the transmission speed of an asynchronous communications channel and tochnically fefers to the maximum number of changes per second that occur in the electrical state of a communicafionscircuit. Computers work with inforManen mbytes - a byte is composed of esght ants - and hese bits are what actually are ftansferned by the modem. So the frue maisure of a modem's transfer speced馣 the number of bits it can send per second. Don't misunderstand, modems still have a baud rate; it's just that this is

The confitision between, and the misuse of, the two lerms originates from the early days of PC telecommumications, when a 300 -baud modem transficred data at 300 bits per second. As modems cholved, the cuidifer on bisp per secoind transfermed actuatly surpassed the baud rating. Forexample, what is referred to as a 1200 -baud modem actually operates at 600 baud and transfers data at 1200 vits per second By conifuifit a 9600 -bps motem following the Y,32 protocol operates at 2400 baiad.

The termband actually the eontraction of the sumame of frenclaman I M.E. Baudot, who derived a five-bit code adopted by the French telegriph iystem in 1877.

more data than the modem can handle on occasion (resulting in a situation somewhat like that of someone running a red light and causing an accident). Another drawback of software (or XON/XOFF) flow control is that it may preclude the transfer of binary files the mere appearance of an XOFF character in a binary file being received may cause the computer to assume the modem wantsitto quit sending data. (When the modem is ready to receive data, it sends an XON - 11 Hex - character to the computer.)
Hardware flow control operates in a manner similar to an electronic device in your car that would automatically apply the brakes as you approached a traffic

\section*{Flow Control}

Fortunately, an error-correcting modem implements a feature known as flow control that tells us when it is ready to receive more data and when to stop sending data. Software flow control operates in a manner similar to that of a traffic light. When the modem cannot handle further data, it sends an XOFF ( 13 Hex ) character to the computer. This is akin to the traffic light turning red. However, the computer may not see the "red light" light immediately. It continues to send data until it notices the traffic light, and this may result in the computer sending
modem technology. Although many standards exist for high-speed modems, the most popular are the US Robotics HST, V. 32 and V. 32 bis. The US Robotics HST proprietary standard transmits data at up to \(14,400 \mathrm{bps}\), in which data is transmitted at \(14,400 \mathrm{bps}\) in one direction and 450 bps in the other direction. The direction of transmittal at \(14,400 \mathrm{bps}\) is changed "on the fly" depending upon which modem has the most data to transmit. The V. 32 international standard transmits data at a base speed of 9600 bps , incorporates the V. 42 errorcorrection protocol and the V.42bis datacompression protocol, and includes a fallback speed of 4800 bps . The V. 32 bis international standard transmits data at a base speed of \(14,400 \mathrm{bps}\), incorporates V. 42 and V.42bis, and includes fall-back speeds of 7200 and \(12,000 \mathrm{bps}\). V. \(32 b i s\) is also completely compatible with V.32, meaning that a modem incorporating V. 32 bis will fall back to 9600 bps if it is connected to a modem incorporating V. 32 .

At the present time very few BBSs support V.32bis, although support is slowly increasing as manufacturers begin to sell V.32bis moderns. Indeed most BBSs and online services still operate at 2400 bps , though the trend is shifting toward 9600 and \(14,400 \mathrm{bps}\).

\section*{Testing}

We tested each of the modems by calling Delphi via SprintNet and Tymnet and by calling various local BBSs. The 9600 -bps modems were also tested with calls to Delphi via one of SprintNet's 9600 -bps nodes and
o CompuServe via its toll-free \(9600-\mathrm{bps}\) number.

> Plone-1ine Surge Prolection
> While they ane rety rave, wiltage surges ox spilies can eater your home or office through ą phone fine and inceparably damage your modem and computer as well as other telecommunications devices such as a fax machine or a telephone. In addition to a surge protector for your computer, you shontd also invest in a surge protector for your modem. You can buy ruch a device at your local Radio Shack store er other computer-supplies vendor, Called the Spike Protector (Cat. No. 43-102), it sells for \(\$ 12.95\) and consists of a three-prong plug unit with RJ-11 modular jacks and a shont telephone cord with modular connectors.

For speed-testing the modems, we used rather large files to gain a better impression of performance. For this reason the tests were performed in-house on our internal phone system, using a Tandy 3000 running the Telegard BBS and the XOO FOSSIL driver and a Tandy 1000 TL/2 running Procomm Plus and Crosstalk Mk. 4. Various combinations of modems were used on both the 1000 and the 3000 . We transferred two test files using the Xmodem, Ymodem and Zmodem file-transfer protocols with each modem. These test files included a 722 K compressed ( \(P K Z I P\) ) file and a \(1.4-\) Meg database file.

\section*{Glossary of Telecommunications Terms}

Bell 103 the North American standard for data communications at 300 bps .

Bell 212A the North American standard for data conturuications ar 1200 bps .
bis a French word loosely wanslated as the samic buit slighrly difierent.
bit an abbreviation for binary digit: refers to the smallest unit of information used in a computer. It has a value of either 0 or L .
bps an acronym for bits per second.
byte a group of cight bits that are considered a single unit.
carrier signal a signal on the telephone line that carries ihe bits to and from your modem.
compression a method of compacting data by way of a mathematical algorithm that removes or eliminates gaps. rodundancies and unnecessary data so the data takes up less stocage space. In telecommunications this means faster data transfer.

CCITT the International Telephone and Telegragh Consultative Committee (CCITT is the abbreviation of its French name): an organization that sets telecommunicationts standards. The CCITT is part of the Intemational Telecommunications Union, which in lum is a part of the United Nations.
eps an acronymin for characters per second; refers to the number of characters per second passing a point in a communications channel.

DCE an acronym for data-communications equipment; generally refers to a modem or printer.

DCE-DCE Speed the speed at which dala is transferred from one moxem to another.

DTE an acronym for data-terminal equipment; generally refers to a computer or terminal.

DTE-DCE Speed the speed at which data is transferred from the computer to the modem.
full duplex a commumications setting that allows the sending and receiving of information at the same time.
half duplex a communications setting that allows the sending and receiving of information in only one direction ar a time.
handshaking the intitial exchange of signals berween two moderms prior to cominection.

MNP an acronym for Microcom Networking Protocol; a proprietary errordetection and -correction protocol. There are several levels of MNP error onrrection, Known as service classes, referring to the specific techniques used by a modem wo transfer data.
parity a form of error checking that increases the chancex of each character's eorrect reception by the other system. Parity is set within the telecommunication software; Even, Odd and None are the most common settings.
protocol a form of agreement between two modems that assures file-transler reliability. Both moderns respond to the same control codes or commands in the same way by following a certain
specified procedure when transferring a file. Protocols range from the simple XOW/XDFF Flow control to the common Xmodem, Ymodem and Zmodem to the lighly sophisticated MNP and V.42bis.
start/stop bits The stan bit is transmitted at the beginning of each byte to notify the receiving modem that the next eight bits contain the data. The stop bit is transmitred at the end of the byte to notify the receiving modem that sending has finished and to prepare for the mext byte.
throughput the total amount of data passed along a communications chamel in a specific time.
V. 22 an intermational standard for data communications at 1200 bps. This standard, used throughout Europe, is rarely used in North America
V.22bis an international standard for data communications at 2400 bps . This standard is used throughout North America and Europe.
V. 32 an intemational standard for data communications at 9600 bps, with an allemate speed of 4800 bps .
V. 32 bis an international standard for data communications at \(14,400 \mathrm{bps}\) with alternate speeds of 7200 and 12,000 bps.
V. 42 an error-correcting protocol featuring an alternate protucol compatible with MNP, an accepted international standard.
V. 42 bis a data-compression protocol providing a data-compression ratio of approximately \(4 ; 1\); an accepted international (CCITT) standard for error correction.

Ximodem an error-checking file-traasfer protocel that transfers data in blocks of 128 bytes. Data is sent one block at a time with an idle period after the transfer of each block while the sender waits for an acknowledgment that the receiver has-received the data correetly, If an error is deteeted, the block is resent. Xmodem was created in 1977 by Ward Christenser.

Ymodem an etror-checking file-transfer protocol that trinsfers data in blocks of 1024 bytes. Data is sent one block at at time with an idle period after the transfer of each block while the sender waitx for an acknowledgment that the receiver has received the data correctly. If an error is delected, the block is resent. Ymodem was adapted from Xmodem by Chuck Forsberg in 1981.

Zmodem an error-checking file-transfer protocol that transfers data in a block length potentially as long as the entire file being transferred. This technique, known as streaming, sends data in subpackets of 1024 byles nonstop, with the receiver remaining silent unless an error is detected. If an error is detected, its position in the file is located to within 1024 bytes; transmission is resumed at that point. In addition to its superior transfer and error-correction techniques. Zunodem also incorporates crush recovery, meaning that if for some reason you lose your connection while downloading a fite, you can call back and resume the download at the point of disconnections you don't have to start the download all over. Zmodem's ereation by Chuck Forsberg in 1986 was funded by Telenet.

Using the 722 K compressed file shows the effects of transferring a file with the V. 42 bis data-compression protocol disabled. The \(1.4-\mathrm{Meg}\) database file was used to show the effects of "optimum" data compression. All data represented in the charts is shown in Figure 1 for your reference. We included this information so you can cross-reference the chart data with the actual numbers. However, the download time shown for the 300 - and \(1200-\mathrm{bps}\) file transfers are estimates, due to the enormous amount of time required to actually transfer the files. Here we noted the amount of data transferred after one hour and then estimated the total download time based on these figures.

Chart 1 shows the average data throughput of the 722 K compressed file and represents the base data throughput without the use of data-compression protocols in the modem - although data compression was enabled throughout the tests. Chart 2 shows the total download time for the same file.

Zoom V. 329600 Modem
An interesting phenomenon occurs when. transferring this file with the Xmodem filetransfer protocol. As noted, the average data throughput is 191 cps with a 2400 -bps modem but is reduced to 150 cps with a 2400 -bps modem using V.42bis. Initially
we thought the settings of the modems were incorrect, but the same result occurred several times after we verified all setings. It appears that Xmodem's small block size and the fact that it is a half-duplex protocol is effectively incompatible with the V. 42 error-correction protocol - although this is speculation on our part. If nothing else, the data in Chart 1 shows the relative inefficiency of the Xmodem file-transfer protocol, especially at the higher speeds.

Chart 3 shows the average data throughput for the \(1.4-\mathrm{Meg}\) database file using V. 42 bis data compression. Chart 4 shows the same data as it relates to the total download time. The data shown in these two charts really expose the inefficiency of Xmodem, especially when it is compared to Zmodem.

However, it should be mentioned that the Zoom modem was tested while connected to a US Robotics HST modem at \(12,000 \mathrm{bps}\) with no data compression, while the V. 32 modem used V. 42 error correction and V.42bis data compression. This makes the Zoom modem appear to be much slower than it actually is. Unfortunately we were unable to locate a compatible modem with V. 32 bis to obtain true timing comparisons. The data in Chart 1 is accurate for the transfer of the compressed file and should give you a good comparison of the base speed of the modems.
If we overlay the results obtained using V. 32 onto the results obtained from the Zoom Turbo modem, we estimate data throughput of the database file at 483 cps for Xmodem, 1676 cps for Ymodem, and 4318 cps for Zmodem. This estimation of the throughput for the Zoom Turbo modem is shown in Figure 5. However, please remember that these three figures are estimated based on the amount of
data compression found for V V. 32 modem.
It is interesting to note that the total transfer time for the 1.4-Meg database file is shorter than the time required to transfer the 722 K compressed file with the V. 42 bis data compression and the Zmodem filetransfer protocol. Remember, though, that the 1.4Meg database file was originally not compressed. When you consider that the 722 K compressed file contains \(1,606,559\) bytes of data, you realize that the two are actually transferring about the same amount of data. Therefore, the compressed file is still transmitted faster than the noncompressed database file.

\section*{Looking at Real Modems}

\section*{Cardinal 9600 V.42bis Modem}

The Cardinal 9600 -bps modem (available from Micro Systems, \$359)
comes in an attractive black-metal case in a style similat to that of Hayes modems. The auto-answer LED on the front panel flashes to indicate an incoming call. The back panel accomodates a power switch, a 5 -pin DIN connector for the external wall transformer, a DB- 25 connector for the serial cable, and two RJ-1 1 phone jacks.

Although its name seems to imply a 2400 -bps modem with V. 42 bis data compression to achieve 9600 -bps throughput, the Cardinal 9600 is a true 9600 -bps modem with the V. 32 protocol. Of course it also supports V. 42 error correction and
V. 42 bis data compression, as well as the MNP alternate protocols. It is also completely backward-compatible with 300 -, \(1200-\) and \(2400-\mathrm{bps}\) modems and uses the Hayes AT command set with input in either upper- or lowercase.

long, and 1.75 inches tall. Indeed its only drawback is its odd size, which may require a bit of imagination on your part to determine where on the desk to put it.

On the back panel are connectors for the external wall transformer, a DB-25 connector for the serial cable, and two RJ-11 phone jacks. One nice feature of the Zoom modem is that the power switch is located on the front panel within easy reach. We found this to be a much better arrangement than that of modems with power switches on the back panel. The features of the modem are comparable to those of the Practical Modem 2400 V. 42 bis.

\section*{Zoom V. 32}

The Zoom V. 32 9600-bps external modem (available from Granite Computer Systems, \$399) comes housed in an attractive white case measuring \(111 / 2\)-by- \(7^{3 / 4}\)-by-2 inches. The power switch is conveniently positioned in the lower-right corner of the front panel. The rear panel of the modem contains two RJ-1 1 jacks for the phone line and an optional telephone, and a connector for the power adapter.

Maximum efficiency is achieved through an onboard \(16-\mathrm{MHz}\) controller and a V. 32 Data Pump. NVRAM is used for storing configuration information, including four 36-digit number strings.

This Zoom modem uses the CCITT V. 32 international standard for 9600 -bps data transmission and also supports 300/1200/ \(2400 / 4800 \mathrm{bps}\). A Turbo mode increases data throughput by kicking data transmission speed up to \(12,000 \mathrm{bps}\) in full-duplex mode when connected to another modem that supports Turbo mode; this includes most V.32bis modems. Communication with V.32bis modems is possible because Turbo mode is a standard modulation technique that conforms to the official CCITT V. 32 bis recommendation.

\section*{Jamming on the Keyboard}

When I press the D or E key on my CoCo 3 keyboard, both letters appear on my screen. That is, if I press \(D\), I get \(D E\) on the screen, and ifI press E, I also get \(D E\) on the screen. The same problem occurs with \(T\) and \(U\), and also with \(M\) and \(L\). What do you think might be the problem? How would you suggest I go about diagnosing and fixing it?

Bob Mueller (KGASK) Azusa, California

AKeys D and E, M and L, and T and U are all in the same columns in the keyboard matrix. The column with D, L, and T goes to Pin 14 of the keyboard PIA. The column with E, M and U goes to Pin 15 of the keyboard PIA. I suspect that with the problem you report, you also are having problems with duplication of the following key pairs: down arrow and left arrow, 4 and 5, comma and dash, and CTRL and F1. Apparently Pins 14 and 15 of the keyboard PIA are shorted, either inside the PIA, on the CoCo circuit board, inside the ribbon-cable socket for the mylar keyboard cable, or inside the keyboard.

Playing the odds, I suspect the problem is inside the keyboard PIA and that you will have to replace the 40 -pin keyboard PIA. Of course try plugging in another keyboard

\section*{Building a Serial Cable}

Connecting a modem to the 4 -pin DIN connector on the rear of the Color Computer can be quite a challenge if you don't have a properly configured cable laying around. If you don't want to build your own modem cable from scratch, pre-made 4-pin DIN to DB-25 cables can be purchased from CoCoPRO ! and modem cables for the RS-232 Pak are readily available from any number of sources, including Radio Shack. If you prefer to make your own cable, you'll need a male 4-pin DIN connector (Catalog No. 274-007), male DB-25 soldercup connector (Catalog No. 276-1547) and hood (Catalog No. 276-1510), and a four to six foot length of 4 -conductor cable (Catalog No. 278-777). You'll also need a soldering iron, \(60 / 40\) rosin-core solder, wire cutters and strippers, screwdrivers, a small vice and two one-inch lengths of stranded wire (for jumpers).

Strip approximately one inch of insulation from each end of the 4-conductor cable, then strip approximately \(1 / 4-\) inch of insulation from each wire on both ends of the cable. Place the 4 -pin DIN connector in the vice and solder one of the wires to each post in the connector. For colorcoding purposes, you might solder the yellow wire to Pin 1 (Carrier Detect), the red wire to Pin 2 (Receive Data), the black wire to Pin 3 (Ground) and the green wire to Pin 4 (Transmit Data)

The Zoom V. 32 supports V.42, MNP 24, V. 42 bis and MNP 5 protocols. All protocols, including the Turbo mode, are automatically negotiated to attain the fastest speed and highest level of compression and error correction supported by both modems in any telecommunication situation.
to see if the problem persists, and to eliminate the possibility that the problem is in the keyboard - although I personally doubt this.

The keyboard PIA is soldered to the board and is best destructively removed: Use cutting pliers to cut all 40 pins of the PIA individually, then use a soldering iron and needle-nose pliers to gently heat and remove all of the pins from the pads for the chip. Then use a solder sucker to clean all 40 holes. Examine both sides of the board carefully for any damaged traces or shorts and, when you are sure all is well, solder in a good quality machine-pin or double-wipe socket (never use a single-wipe socket) where the PIA used to be. Tandy is the only source of official keyboard PIAs for the CoCo 3, but I have been told by Jim Harrison that a 68 B 21 will work as a keyboard PIA, and the 68B21 is readily available at most electronics outlets.

\section*{RS-232 Ports}

What is the difference berween the Disto RS-232 port on the little board inside Disto disk controllers, the RS-232 port provided by the Tandy \(R S\)-232 Pak and the CoCoPRO! RS-232 pack?

Lute Mullenix (LUTE)
Hazel, South Dakota
The Disto RS-232 port, Tandy RS232 Pak, and CoCoPRO! RS-232 pack all use the same 6551 ACIA to convert parallel data on the CoCo system bus to serial data at 150 to 19,200 bps. However, the Disto mini-bus RS-232 port is addressed at \$FF50 through \$FF5F, whereas both the Tandy RS-232 Pak and the CoCoPRO! RS232 pak address the 6651 ACIA at \$FF68

Once all wires are soldered, remove the DIN connector from the vice and put the DB- 25 connector in the vice. Turn the cable over so that the end with the DIN connector is facing the floor and slide the hood for the DIN connector down the cable-make sure the hood is facing in the correct direction. Don't snap the hood in place just yet.

Hold both one-inch jumpers in one hand in parallel and twist one end together so that it forms a " \(Y\) " jumper. Tack solder the connection using just enough solder to hold the wires together. Assuming you used the sarne colored wires mentioned previously, twist one end of the \(Y\) jumper with the yellow wire and tack solder it in place. Insert one end of the \(Y\) jumper into Pin 6 and solder it in place. Solder another end of the \(Y\) jumper to Pin 8, and the remaining end to Pin 20. Solder the green wire to Pin 2, the red wire to Pin 3 and the black wire to Pin 7.

After all connections have been soldered, use an ohmmeter to measure the resistance from each pin of the DIN connector to each pin of the DB- 25 connector. If everything checks out, install the hoods on the connectors and connect the cable to the serial port and modem. At this point you should have a working serial cable.

Other features found on the Zoom V. 32 modem include. both asynchronous- and synchronous-operation modes, the ability to force MNP 2-4, V.42, MNP 5 or V. 42 bis, automatic self-diagnostics, and support of both the AT and extended AT command sets.
through \$FF6B. Thus, the same OS-9 device driver can be used with any of these ports, but the device descriptor for the Disto port reflects the different address at which its 6551 ACLA is mapped.

A minor difference between the CoCoPRO! RS-232 pack and the Tandy RS232 Pak is that the CoCoPRO! unit does not support the CTS, RTS, and DSR lines of the RS-232 port. A major difference is that the CoCoPRO! RS-232 pack is currently in production and available for sale, whereas Tandy's RS-232 Pak is no longer available commercially - although used Tandy RS232 Paks may be available in the Classified Ads section of the CoCo SIG on Delphi.

\section*{NEC MultiSync II}

How can I connect my NEC MultiSync II monitor to my CoCo 3?

Ken Dorsey
Fort Worth, Texa

AThe NEC Multisync \(\Pi\) monitor can be used with the CoCo 3. Make a cable that connects red, green, blue, horizontal sync, vertical sync, and ground lines from the CoCo 3's RGB video connector to those pins on the NEC MultiSync II. Then set the MultiSync II for Analog RGB input. If the monitor has a setting for horizontal- or vertical-sync polarity, be sure to set it for positive sync. You should get an excellent, sharp image on the NEC MultiSync II.

erly using my cable and drives, and when I use the suspect controller with another cable and drives, I again cannot format disks. I believe the problem is in the controller; any suggestions on how to fix it?

Brian Schubring (THESCHU) Bloomingdale, Illinois

AYou have done excellent diagnostic tests, and I agree with your conclusion. The index pulse from the disk drive is used for the Read Track and Write Track functions. Now, the Read Track function is not used by Disk basic, but the Write Track function is used to format a track. The index pulses are not used at all during normal read and write operations, which are the operations used to read and write files on an already formatted disk. What all this means is that a failure to format where reading and writing files is OK is almost certainly the result of a problem with the index pulse. The index pulses arrive at the disk controller on Pin 8 of the 34 -pin cable. There is a 150 -ohm pullup resistor attached to this line, which is then sent directly to Pin 24 of the 1773 floppy-disk controller chip. That is all there is to the index circutry on the FD502 card. Check the circuit very carefully. Look for lack of continuity between Pin 8 on the disk-controller cable and Pin 24 of the 1773 FDC chip. Look for a possible short to ground. If neither is present, the problem is with the 1773 chip, which must be replaced.
(Brian replied on Delphi the day after I suggested this approach: I checked the FD502 controller as you suggested and found a short between Pin 8 of the 34 -pin ribboncable connector and ground, due probably to poor quality control. The short was on the solder side of the board in the vicinity of one of those little choke coils. I removed the

\section*{Good Times With OS-9} Level 2 Game Pack

Mind games - mol the kind played on people, but those played on the computer bave always beep one of my favorite pastimes. The computer provides an ideal enviromment for many types of these games. Without the need for a human opponent or the hassles of setting up a game board, you can jump right in and start having fun: board-game pieces scattering across the floor are but a memory.

OS-9 Level 2 Game Pack provides many hours of entertainment with its offering of five challenging games: CoCorhello. CoCoYahrzes. KnightsBridge. Minefield, and Sca Banle.

Sea Banle is the CoCo version of the game Rattlestip by Milton Bradley. The play fied is represented by two 10 -by- 10 grick, on one of which you place four stips and one submarine. \section*{96-TPI Disks}

1 saw some \(51 / 4\)-inch disks for sale that were described as 96-TPI, 80-track Can I use these with my 40 -track doublesided drives?

Alain Pilon (ALAIN)
Brossard, Quebec
Conada

AThere is a great deal of confusion in the naming of \(51 / 4\)-inch disks. All \(51 / 4\) inch 80 -track disks have 96 tracks per inch (TPI), and all \(51 / 4\)-inch 40 -track disks have 48 tracks per inch. However, the total number of tracks that can be formatted is not the whole story. There are two types of 51/4-inch 80-track (96-TPI) disk drives. Long ago some 80 -track drives were made that were fundamentally similar to 40 -track drives except the tracks were half the width. These 80 -track drives could hold a total of 720 K of formatted data and were used in CP/M systems, and for a while were popular with OS-9 users. Disks specifically made for these drives were called 80 -track, \(96-\) TPI disks and were, at one time, called Quad Density - an extremely stupid and confusing name, in my opinion. Such disks would work fine with 40 -track drives, too. Today's \(51 / 4\)-inch 40 -track disks should, by and large, work fine in those old \(51 / 4\)-inch 80 track drives. Some years back IBM introduced a wholly different kind of \(5 \frac{1}{4}\)-inch 80 track, 96 -TPI drive. It has been variously called the AT-style, High-Density, or 1.2Meg drive. These drives use a higher-speed disk controller and cannot be used with ordinary Color Computer disk controllers. Further, these drives use disks that have very differentmedia. The media for the 1.2 -

Meg disks have more than twice the magnetic coercivity than that for the 360 K and 720 K drives. Thus, a high-density, \(1.2-\) Meg, AT-style disk cannot be used in a 40 track drive. The problem is that both the high-density, AT-style, \(1.2-\mathrm{Meg}\) disks (which cannot be used in a Co Co drive) and the 720 K -style \(51 / 4\)-inch disks (which can be used) have 80 tracks. Saying the disk is \(80-\) track or 96-TPI does not distinguish be tween these two totally different types of disks. By common convention, I suspect the disks you are looking at are not ATstyle, \(1.2-\mathrm{Meg}\) disks, for those are usually termed High-Density, \(1.2-\mathrm{Meg}\) or AT-style

Multi-Paks and RS-232s 1. If I put a new upgraded PAL into my Multi-Pak Interface, will I lose the ability to run CoCo 1 and 2 programs?
2. How can I hook up my Avatex 1200 bps modem (which I am currently using with a Deluxe RS-232 Pak via the MultiPak) directly to the 4-pin serial port on the CoCo 3?
3. Sometimes the Send Data light stays on when I am using my modem with the \(R S\) 232 Pak, and the terminal program hangs. I suspect the RS-232 Pak may be failing, and I want to check the terminal program and modem with the bit-banger port. What could be wrong with my RS-232 Pak?

Edward Stroh (COCO512K) Hornton, Illinois

1. Upgrading the Multi-Pak Interface for the CoCo 3 will not affect the operation of any CoCo 1 or 2 software that already works on your CoCo 3. It will have an effect on the ability of the Multi-Pak to work with a few obscure, obsolete, ancient hardware cards that were made for the CoCo 1 and 2. For example, the CoCo Max joy
uses 14 chess knights - seven black and seven white. The garne is played against the computer on a 7 -by- 7 grid. The knights are placed on the back rows of opposing sides of the board. The wirner is the player who first captures five of the enemy's knighrs. Knights move the same as of a chess board. However, there is a catch: Which knight you or the computer may move is randomly selected.
CaCoYahrice is. of course, Milton Bradley's. Yahrzee in sheer shwep'x clothing. The computer rolls the dice, and you select which diee to keep and which to roll again to make combinations amounting the highest point score possible. The rules are the same as those for the original game.

All of the games are entertaining. OS-9 Level II, a CoCo 3 with at least 256 K , a dick drive, and a monitor are the only requirements. To get a game up and rumning is simple:- Merge stdfonts, stdptrs and stidpass_4 from the SYS directory of your OS-9 disk. Next. change the execution and data directories to the CMD5 directory of the pames disk. All you need to do then is type the filename of the perticular game you want to play.

The manual explains how to create a bootable games disk and frow to use the games as GShell (Mulfi-Vue type) applicationc. Icon and AIF files are supplied on the disk. However, neither Multi-Vue rior the-Multi-Vue VIMOINT module are required to play the games. Hard-drive procedures

stick adapter, the PBJ Word Pak (non-RS models) and the original Microworks DS69 cards will not work with a Multi-Pak that has been upgraded for operation with the CoCo 3 . Of course those cards would not work in a CoCo 3 to begin with because the port addresses conflict with those of the GIME chip. But now a Multi-Pak upgraded for CoCo 3 operation will no longer be able to be used with those cards and a CoCo 1 or 2. This is the only loss involved in such an upgrade. All commonly used and modern cards should still work fine with the MultiPak and with either the \(\operatorname{CoCo} 1,2\) or 3 .

Modem \\
DB-25
\end{tabular} \\
1 & 8 \\
2 & 3 \\
3 & 7 \\
4 & 2
\end{tabular}
3. The first thing I would look for if the RS-232 Pak is failing is a defective 1488 or 1489 level-converter chip. These chips are "hooked to the outside world" and are the first to get zapped if some nasty juice comes down the line from the modem cable. However, your description of the problem makes me wonder if there is some software or subtle system-hardware problem completely separate from the RS-232 Pak.

\section*{QAQAQA}

Experimental Modification
In a document circulated on the CoCo mailing list on March 27, 1991, Charles C. Bundy, IV, describes the results of a fascinating experiment he performed on his CoCo 3. I have asked, and received, his permission to relay news of his work to readers of this column.

Charles noticed a difference in the way timing for the 74LS138 chip (which decodes address space for the ROMs and the *SCS and *CTS lines) is handled between the CoCo 1 and 2 and the CoCo 3 . The 74 LS 138 is gated with the S2 line of the SAM chip and E-clock on the CoCo 1 and 2, as per Motorola's recommendation in its tech manual for the 74LS783 and 74LS785 (SAM) chip. This is, however, not the case for the 74LS138 chip in the CoCo 3. When Charles added this extra gating, all sparklies he had experienced with OS-9 when using an oIder (1986) GLME chip disappeared, his BLOB (Boot-List-Order Bug) problem disappeared, and a problem he had running his Performance Peripherals NoHalt disk controller with his Burke and Burke hard-drive interface was cured

The "fix" that Charles performed is as follows: Take a 74LSO2 (quad-NOR gate) and suitably mount and apply power to it. Tie High all inputs for three of its four gates. Leave the outputs of those gates unconnected. You have now in effect discarded three of the four NOR gates on the 74LS02 chip. Regarding the remaining NOR gate: Connect the S 2 line from the GIME chip (available at Pin 3 of IC9, the 74LS138 chip) to one of the inputs of the remaining NOR gate on the 74LS02 you just installed. Connect the E-clock from the GIME chip (available at the intersection of \(\mathbf{R} 9\), a 47 ohm resistor, and C10, a 39-pF capacitor) to the other input of the NOR gate. Now free either Pin 4 or Pin 5 (the *G2A or *G2B pin) of IC9. Note that both of these pins are grounded. The best way to do this is to destructively remove the 74LS138, clean all the holes, install a socket, and put in a new 74LS138 (or 74F138) with either Pin4 or 5 bent up. Alternatively, if you are very
dexterous with fine cutting pliers, you may be able to cut Pin 4 (or Pin 5) where it attaches to the circuit board, and have enough of a stub left to bend and solder a wire to. Feed the output of the NOR gate to Pin 4 or 5 of the 74L.S138 that you just freed.

What you have done is gated the 74 LS138 so that the ROMs are euabled only during the E-clock portion of the read cycle. Charles notes that the CoCo 3 Tech manual on Page 36 claims that the CoCo 3 is supplicd with this property, but that this

claim is wrong. Only after his fix, Charles states, will the ROM decoding be restricted to the E clock portion of the read cycle.

This fix is, as Charles very clearly notes in his original document, very experimental, and should be done only by hackers who are very comfortable with doing such modifications using the kind of rough guidelines I provide here. Prefcrably, it should also only be done by those who are experiencing subtle hardware problems such as sparklies, weird inexplicable incompatibilities, and persistent BLOB problems. I wel-

\section*{Feature Program}

\section*{Master List: A Feature-packed Filer}

While many multipurpose database programs are usctul for storing address information, they are almost overkill for this application. Then, too, because they are designed for a broad spectrum of uses, they aren't easily fine-tuned for storing addresses or other card-file information.

Master List is specifically designed to be an address database. It offers features found in the major database programs along with some that aren t . The program runs on the 32 -column screen and works with any Color Computer with at least 64 K and one disk drive.

To set up Master List, first enter the BASIC programs shown in listings 1 through 3 and save them to a new formatted disk using the indicated filenames. Now run MLDATA, which creates a machine-language routine and saves it to disk.

To get Master List running, enter RUN" \(B 00 T\) ". This short program loads the machine-language routine from disk, displays the main screen, then runs the main program, MLIST.

At this point, eight data fields appear onscreen, along with several commands shown at the bottom of the screen. The fields and their intended uses are
\begin{tabular}{ll} 
NAME & person's last name \\
NAME & person's first name \\
CORP & a company name \\
ADRS & number and street \\
CITY & town or village \\
PROV & province or state; \\
& include zip \\
MISC & \begin{tabular}{l} 
personal notes \\
TEL\#
\end{tabular} \\
telephone number
\end{tabular}

Each of these eight data fields is 25 characters in length. Together the fields form a single database record. All the records together make up a file.

When Master List starts, you are prompted for the date. You can enter it in any format you want, but you must limit your entry to eight characters. The program then saves the date on Track 17, Sector 1 of the disk in

for the name of the file you want to open. If you press ENTER without typing a filcname, the defaul filename, MLIST. DAT, is used.

When the file is opened (or the new file created), the field by which the file is sorted is indicated at the top of the screen. Just below this, in the center of the screen, is an indication of the total number of records in the file and the number of the record currently displayed. Use the right- and leftarrow keys to scroll through the records in a file.

The command menu is displayed at the bottom of the screen. Actually there are two menus, and you toggle between them by pressing the space bar. When the menus flash, you can select a command. Do this by pressing the first letter of the command name. Following are descriptions of the Master List commands available from the first menu:

ADD - Use this command to add names to the file. When you select it, the screen clears and the record number is updated. Enter the appropriate information in each field. pressing ENTER after each line. When you have finished, the record is saved to disk and you are returned to the command mode. To abort the record, press BREAK before entering the last line of text.

DELete - When you pick this option, you are asked whether or not you want a selective deletion. If you press Y, Master List deletes all marked records (see the MARK command for details). If you press N at the prompt, Master List deletes only the currently displayed record.

The space previously used by a deleted record is not automatically freed - the empty record remains and wastes space in the file. Use the SORT command to eliminate this.

EDIT - Use the EDIT command to correct typing errors or update a record with new information. After you select this command, move around the data screen by using which you reach by pressing the space bar offers six more commands. These commands are as follows:
fileNAME - Select this command to start working on a different database file. Type the name of the desired file (no filename extension is necessary) and press ENTER.

XFER - Use this command to transfer records between files without having to retype the data. When selected, XFER gives you two options: Use Transfer to send data to another file or Append to rereive data from another file. After you make your selection, you are prompted for whether or not you want a selective XFER. If you press Y, all marked records are involved. If you
press N , all records foltowing the currently displayed record are transferred or appended. You are then prompted for the name of the second file.

MARK - Use MARK to indicate a group of records for printing, deleting or transfers. When MARK is selected, a submenu appears with the following options:
- Travel - allows you to move through the file (using the arrow keys) and calls up a second submenu with four new options:
Mark - marks the current record
Unmark -- unmarks the current record
Delete - deletes the current record Space bar-returns to previous menu - Find - lets you locate every occurrence of a string and marks all corresponding records.
- Mark - marks the current record.
- Unmark - unmarks the currently displayed record.
- Remove - removes all markers from the file.

DISK - This command shows the directory of the disk in the specified drive.

RESTORE - The RESTORE command can be used to restore all records that have been previously deleted, assuming their slots haven't been removed by SORT.

QUIT - Use this command to exit Master List. The program itself is not erased from memory.

A final note of caution regarding the use of Master List is in order: The BREAK key is not fully trapped. Other than those situations indicated above, pressing BREAK to abort a command causes the program to stop. To get Master List running again, just enter run. You'll be prompted for the filename but not the date. However, any data not saved to disk before you pressed BREAK will be lost.

I hope you enjoy using Master List, and I believe you will find it a powerful addition to your Color Computer library.

The critics will be raving about this strategy game！Based on an original concept by author Jeff Steidel， Photon is an addictive time－muncher in the spirit of Lemmingsiss and Tetrism．Match wits with Ludevide，the evil power droid，as you reason your way through over 60 devious levels．Thenumerous original music scores，digitized speech and sound effects，and pleasing animation and graphics enrich Photon to make it an unparalleled gaming erperience．Soon to be released on a variety of computer platforms，the CoCo Community is lucky enough wh be given first glance at this fantastic game！Req． \(128 \mathrm{k} \mathrm{CoCo}-3\) ，disk drive，and joystick．

\section*{SPEED UP YOUR PROGRAMS with MLBASIC}

Are you tired of waiting for BASIC programs to finish running？Are you looking for faster running programs without having to learn assembly language？Do you like BASIC programming，but would like more flexibility in writing programs with more functions and capability？If your answer is yes to any of these questions，of even if it isn＇t，MLBASIC is the program you should have．
MLBASIC is a program that converts BASIC programs into super fast machine language programs．MLBASIC is a BASIC compiler which produces a machine language program． The program will then run by simply using the LOADM command．This means no other BASIC or runtime programs are required when running programs compiled by MLBASIC
Written in machine language，MLBASIC can compile programs larger than 32K．Normal BASIC numbers（ 9 digit，floating point）and string variables and arrays are supported，plus 16 bit INTEGER numbers and variables，not offered with normal BASIC，is available． BASIC COMMANDS SUPPORTED

\title{
Losit and Found: An 0S-9 File Finder
}

Where in the world did you put that letter you wrote last summer to your Aunt Esmerelda about her health insurance? Is it in the directory with family correspondence? Or did you put it in the directory with the medical records? Perhaps it's in with the insurance data . . . or maybe the financial stuff.

In the June 1989 issue of the rainBow, Dale Puckett described a recursive BASIC09 utility that helps users who find themselves in such a dilemma. Find searches the OS-9 directory tree to help you locate files that are "Iost" somewhere down among the many branches.

One of the beauties of OS-9 is its ability to perform the same function in different ways. My version of Find is written in machine language and provides a big speed advantage over the BASIC09 version. For example, one of my data disks uses five directories and contains a total of 169 files. Find searched the entire disk in 28 seconds and displayed the locations of two specified files. This is over seven times faster than the three minutes and 32 seconds required by the BASICO9 version to perform the same job. Because of the way OS-9 stores file entries, faster speeds would be difficult to obtain.

\section*{Using Find}

To locate a file (or files), type find, followed by the name of the file or subdirectory you want to find, and the name or pathlist of the directory where you want the search to start. If you can't remember the full filename or if you want to search for multiple files, just enter a part of the filename to be found. For example, the command line
find .bak /dl
tells OS-9 to seanch the entire disk in Drive 1 , starting at the root directory, for any files containing the string .bak (which is the extension my word processor uses for backup files). For one of my data disks, OS-9 responds as shown in Figure 1. It is important to note that Find locates all file and directory names containing the search string regardless of the case of the characters you enter on the command line or the case of the characters in the actual filename.

Find accepts a -p option, which when

\section*{find.bak found in /D1/DOCS}
dad891207.bak found in /D1/FAMILY
college_loan.bak found in /D1/SCHOOL/FINANCES

entered immediately following find in the command line causes the program to display only the pathlists of the files found. (See Figure 2.) These pathlists can be used to feed other utilities via OS-9 pipes.

If you want to exit Find at any time during execution, press the space bar. Find is recursive; if you press BREAK in---
stead, you may be left with one or more incarnations running as background tasks.

The Program
When Find is executed, the directory is changed to the desired directory, which is then opened and read.
subdirectory is then opened and searched in the same manner, running Find again for each lower level in the directory tree.

When a directory has been fully searched, the current incarnation of Find terminates and returns execution to its parent. The search continues until all files in the starting directory and lower-level directories have been examined.
While developing Find, I discovered
Each filename is compared to the search string. If a match is found, the location message is displayed onscreen.

The attribute bytes of each entry are also read to see if the entry is a directory. If a subdirectory is found, Find reexecutes itself using the new directory's pathlist with a null byte ( 0 ) added at the end to indicate it is a subdirectory. The

Find can be a real time saver for those, like me, who can't remember where their files are located. I hope it is helpful to you, too.

\section*{Duo Deck Solitaire：Two Decks Are Better Than One}

Duo Deck Solitaire is a CoCo 3 package that consists of two different games of soli－ taire，each of which uses two decks of cards to play．Now，you might wonder why any－ one would want to play solitaire on a com－ puter when a real live，three－dimensional deck of cards is so readily available．Other than the mundane task of shuffling two decks and having more cards wind up on the floor and your lap，the computer is a stickler when it comes to playing by the rules and won＇t let you improvise，adjust or allow you to make any illegal moves．It doesn＇t let you cheat，is what it does．
Both games，Windmill and Sly Fox，re－
quire thought and strategy，although a bit of luck doesn＇t hurt．To win either game is about as easy as nailing Jell－O to a wall and as likely as having a centipede on crutches win the 100 －yard dash in the Olympics．

Sty Fox
The object in Sly Fox is to build four

foundations of the same suit in ascending order（Ace to King）on the left side and to build another four foundations of the same suit in descending order（King to Ace）on the right side．In the middle are 20 storage， or waste，piles from which you can draw cards to place on the foundations．When play from the storage piles is no longer possible，you simply draw 20 new cards from the deck and place them on the storage piles，which may mean burying some that are still there．You repeat the previous step and use the new cards to build foundations．

\section*{Windmill}

The object of Windmill is similar to Sly Fox in that you are building foundations． The thing to remember is that you can build only on the center square（the Ace founda－ tion）or on the four squares between the arm （the King foundations）．You may place

cards from the deck on any empty square， but you cannot build on them．The Ace foundation（center pile）is built in ascend－ ing order（Ace to King），while the King foundations are built in descending order． You may place a card on a foundation at any time，but it cannot be taken consecutively from the same pile．For example：If your Ace foundation is up to 6 and a King foun－ dation has all the cards from king to 7 ，you cannot play the \(7,8,9\) ，etc．，from that pile－ just the first card．Thus you may take the 7 but must look elsewhere for the 8

The rules may seem a bit confusing at first but aren＇t all that bad once play begins． Besides，the games will emit a beep and not allow you to make illegal moves．Plus，you can always view the rules，onscreen，any time during play by pressing the question mark（？）．

All options are selected using an on－ screen pointer that is operated by mouse or joystick．Simply move the pointer to the card you want to move and click the button． This highlights the card．Then move the pointer to the spot where you want to move the card and click the button again．One note of caution：The program does not support a Hi－Res interface．Those who are using one must unplug the interface in order for the joystick or mouse to work properly．
The graphics for this CoCo 3－only pro－ gram are good and play is smooth．The games are stimulating，challenging and fun to play，although hard to win．The only thing lacking is a score．It would be nice to be able to see，via a score or points，whether a certain strategy produces better results than another or just to see if you can better a previous score．
For those who enjoy solitaire but are looking for something more challenging than just flipping cards over，Duo Deck Solitaire is a must．（Eversoft Games，Ltd．， P．O．Box 3354，Arlington，WA 98223－3354， 206－653－5263；\(\$ 19.95\) plus \(\$ 2.50 \mathrm{~S} / \mathrm{H}\) ．）
－George Aftamonow

When basic on the Color Computer encounters a GOSUB or GOTO statement，it first compares the target line number with the current line number．If the tar－ get line number is higher，BASIC begins its search for the subroutine at the cur－ rent position．If the target line number is lower，however，the search starts from the beginning of the program．

To increase the speed of your pro－ grams，put subroutines as close to the beginning as possible．Use a GOTO in front of them，pointing to where the program should normally start so the subroutines are bypassed when you run the program．A further speed increase can be seen if you put the subroutines in decreasing order of the frequency of their use（i．e．，most－used subroutines first）．
