

THE COLOR COMPUTER MONTHLY MAGAZINE
September 1992 vol. xil №. 2

M
ost CoCo 3 owners wish there were some way they could alter their machines to make them run faster; while owners of PC compatibles have for years been buying faster and faster computers, the speed at which the CoCo executes programs has remained the same since the CoCo 3 was introduced.

Some OS-9 users and hardware hackers have been so desperate to squeeze additional performance out of the Color Computer that they've tried various bizarre and chancy hardware modifications - a few have gone so far as to install a faster clock crystal. (They did achieve roughly a 10 percent increase in speed, bnt at the expense of rendering most monitors useless with the CoCo because the timing of the video signal was also affected.) Such a modi-
fication is
more a curious intellectual exercise than any kind of practical route to speeding up the CoCo 3 .

Now, however, a sound and reliable means exists for speeding up program exccution on the CoCo 3 , at least under OS-9 Level II, by 10 to 30 percent (possibly up to 50 percent in the near future). This means is the Hitachi 6309 microprocessor, which is available through electronies parts houses and as part of a complete kit, called PowerBoost, sold by Burke \& Burke (see the review, at right). The potential importance
of the 6309 microprocessor to Color Computer users has come to light, thanks to the recent unofficial release of information about the chip.

The 6809 and the 6309:
A History of the Technology
As most CoCo users know, the microprocessor used in the Color Computer 3 is the Motorola 68B09E. The 6809 family of microproccssors was engineered using

See 6309 on Page 15
$\square$

# Product Review <br> $$
\begin{aligned} & \text { POWERBOOST: } \\ & \text { SPEEDING UP THE COCO } \end{aligned}
$$ 

Chris Burke learned of the hidden registers, instructions and modes of the Hitachi 6309 roughly a month before the Chicago 1992 CoCofest, and it immediately occurred to him that he could use these enhancements to make OS-9 software (system and applications) execute more quickly. In one month, Chris devised over 50 separate patches to modules in the OS-9 system. These patches have become an important part of a new product Burke \& Burke calls PowerBoost.

The PowerBoost package includes a Hitachi 63B09E, a 40 -pin socket and a specially formatted disk including the patches to OS-9, as well as some patches to Disk BASIC. The idea is that you replace the 68 B 09 E in your CoCo 3 with the socket and 6309 , then patch the software to take advantage of the new features, increasing the speed at which the CoCo 3 performs.

The patches Chris had devised prior to the Chicago show prodnced a noticeable and impressive speed increase in a CoCo 3 running OS-9 Level II. How impressive is impressive? A given

mdir e took 8.75 seconds without the patches installed and 5.5 seconds with the patches - a 40-percent speed increase. In another test in which the CoCo 3 was asked to read a full megabyte of data from a hard drive it took 55.5 seconds without the patches and 39.5 seconds with the patches - again a throughput increase of about 40 percent. In a more dramatic (but less trnly meaningful) demonstration, performing a cobbler to a RAM disk took 20 seconds without the patches and only 1.8 seconds with patches. What this would translate to for "cobblering" a floppy disk is dependent upon the efficiency of the data transfer from the system to the drive. It is important to note, too, that these fignres represent performance increases while in the emulation mode of the 6309 , not the native mode in which fewer instruction cycles are required.

The OS-9 patcher program Chris supplies is an exceptionally professional item. As it installs itself, it goes one by one throngh the modules, shows the user which modnles it recognizes as patchable, and

## A Promising Education

It is common knowledge that computers, CoCos included, are widely used in the field of education. But those of us without children, or whose children have finished their educations, often lose sight of just how important and effective the use of computers can be when combined with traditional educational methods. And there are several approaches that can be taken to enhance the educational process through the use of computers.

The most common strategy used today is the drill program, a program with which students are quizzed by the computer. Working much like flash cards, such programs are useful for teaching everything from simple math and spelling to anatomy and chemistry.

Another tactic is to first teach the given subject through traditional methods. Then after the students have a basic understanding of the subject, the computer is used to present concrete examples (proof) of the material learned. This approach is used by Louis Toscano in "The Electronic Blackboard" (THE Rainbow, September 1987, Page 106). As he explains in that article, Mr. Toscano first introduces the concepts of calculus, then uses the CoCo to show the students how the graphs and equations relate in physical terms.

A third approach is to teach the material in a traditional manner, then let the students actually use what they have learned in a physical way. While it seems this method is used less frequently than the other two I've mentioned, it can be highly effective since the students are given some way to mentally base the material they are given a tangible use for the material, reinforcing their learning efforts. This approach has been used by Bob Teague, a RAINBOW reader. We recently received the following letter from Mr. Teague and his algebra class:

## Dear Sir:

I teach mathematics and science at Winthrop High School in

Winthrop, Maine, where there are eight CoCos in the computer lab in my classroom. We receive THE RAINBOW and RAINBOW ON DISK each month, and many of the programs you have provided are integrated into my math and science courses. The CoCos are in constant use by my students.

During our study of solving equations in one unknown, I decided to challenge some of the students in my Algebra I course by having them create a program to solve equations in several forms. Once they understood how to solve the equations by hand, the students set about teaching the computer to solve the equations electronically through BASIC.

The work went slowly at first, but once the students got into the project, it proceeded quickly. Since many of the students had little programming experience, I helped with some of the mechanics of building a menu-driven program. The result is Equation Solver, which the class and I hope will inspire other algebra students to try their hands at programming. BASIC is alive and well in Mr. Teague's Period 1 algebra class.

Keep those great programs coming. We look forward to exploring the disk each month.

Sincerely yours,
Mr. Bob Teague and students:

| Jaime Clark | Darcy Dunn |
| :--- | :---: |
| Dana Fales | Ethan Foyt |
| Levi Huntley | Marty Matthews |
| Crystal Pendexter | Lynn Scribner |
| Barbie Williams | Eric Weher |
| Frank Fitzgerald | Veronica Guimont |
| Amy Phillips | Mike Murphy |
| Amy Bryant | Ethan Savage |
| Jess Shepard |  |

Enclosed with the letter was a disk containing the result of Mr. Teague's class's efforts, which I am printing here for your use and educational benefit.

I think the students in Mr. Teague's class deserve, at the very least, a big pat on the back, as does Mr. Teague. Their creation, after all, is the very meaning of education.

- Lonnie Falk

## Back on Track

## Editor:

I just started my subscription to THE RAINBOW and am thrilled to see a magazine devoted to the Color Computer. After having my PC stolen, I wasn't ready to invest a major amount of money iuto another, then buy all the software again. So I took my CoCo 3 out of mothballs, plugged in several programs and rediscovered the CoCo magic.

Now, I'm investing in most of your advertisers to upgrade my computer to its full potential. A friend came over and watched me put the CoCothrough some of itspaces. He was impressed with its performance and color graphics (and he owns a 386based PC).

Ihad almost forgotten the fun of writing my own programs - the sense of accomplishment and satisfaction from designing aud debugging. I hope in the not-too-dis-tant-future to submit short "fun" programs for RAINBOW readers. Until that time, your publication helps me in my search for all the tools and accessories available for my CoCo 3. Thank you for a fine monthly publication and a double kndos to your
readers and advertisers for keeping the CoCo alive.

CJ. Ryan
ST 3, USCGC Gallatin Governors Island New York, NY 10004

## Needs a CoCo 3 Replacement

Editor:
We have four different types of computers in our household (Apple, Atari, TI and CoCo ), and the CoCo is my favorite. Now my CoCo 3 is on the fritz, and I want another one. If one of your readers has a CoCo 3 he wouldn't mind parting with, I'd really appreciate hearing from him.

Jason Sikes
6209 NE 96th Avenue
Vancouver, WA 98662

## Thanks for Scratching Our Backs Editor:

Having worked in retail bookstore operations and purchasing for a number of years, I know the costs and problems involved in dealing with dealers and wholesalers, all in the name of "distribution." I have watched each month the shrinking size of THE RAINBOW, the format changes. the shrinking size of the advertising base, the letters and readers becoming more critical (and no doubt, loss of subseriptions), and the smaller size of articles and programs. The general public does not realize what it takes to get a publication in print or the money and time involved in getting it to the reader.

We are a dying breed out here, and you are our only stable contact. With everyone so quick to bail out on us, you seem to be trying to do anything and everything possible to continue your support to us. People are always very quick to criticize wheu they donot like something, but are not always so quick to help. These people need to be encouraged to suppon you more with suggestions, submissions and involvement with the only lifeline for their $\operatorname{CoCos}$. They need to support the advertisers more, or they too will be gone - and subscriptions alone do not pay the bills. This is a readers' publicatiou, aud only by their input will it continue to be so.

After years of newsstand purchasing, I have finally subscribed. I also purchased a number of back issues - within two weeks they were here. I was one issue short, and with a quick call to your 800 number I was assured it would be on its way without delay. Please compliment your staff on the service they provided.

For what it is worth, you have my support and dollars as long as you need them. With my subscription, you pledged to support me with your magazine. In turn, my pledge is to try to be a better and more supponiug reader io whatever way I can.

## In Defense of the 68000

Editor:
I have never had any complaints with THE RAINBOW, but after reading "Print \#-2" in the May 1992 issue, I want to give my opinion about the new OSK/68000-based computers.

I am very pleased with the service my CoCo has given me over the last three years, and I will keep it as long as it displays the Disk Extended BASIC message when I turn it on. But if I ever need to have more power, I would really like to use one of the new 68000 -based computers. I have used MS-DOS, and I think OS-9 is more power-
ful. Besides, I am already familiar with OS9 because I have used it on my CoCo .

In his May column, Lonnie said the main reason the new computers will not serve us well in the future is because of the lack of software. From what I have read in THE Rainbow, the CoCo was in a similar position when it was introduced 12 years ago. There were only a few ROM Paks from Radio Shack and nothing more. It was the support and dedication of the CoCo Community that made the CoCo the great machine it is today.

If we give this same support and dedication to the companies and programmers developing software for the new machines, we will make the new computers as good as the CoCo, with the same variety in software and hardware. And the CoCo Community will continue to exist for many years to come, with THE RAINBOW right there with us. Thank you for letting me express my opinion.

Luis Tanon Garcia P.O. Box 475

Naranjito. PR 00719

## Adventurer Needs Help

Editor:
Help! How do I get that stupid parrot to eat the birdseed on the string in the game Caladuril, Flame of Light? Anyone who can help, please write to me.

Johnnie Hirst
P.O. Box 2092

Beeville, TX 78104

## Editor:

At first I didn't care for the new format of THE RAINBOW, and I seriously thought about not resubscribing. But after having the chance to get used to the new format, I like it. As other readers have pointed out, it is easier to read without the glare from the glossy pages. The ads are larger, and I find it much easier to handle while I read it.

Other people have valid points too, regarding the bulkiness and the awkwardness of storing the rainbow. But people must realize that with time comes changes, aud we must adapt to those changes.

Sometimes I get tired of reading letters in which people "cry" because of the new format or the reduced size. I wish these people would ask themselves, "What have I done to support THE RAINBOW recently? Have I submitted au article? Do I support the advertisers?"

Come on, people, get with it. If we lose our Rainbow, we have nothing. Do your part. Support any way you can. All we need to do is stick together to keep the CoCo Community together. As John F. Kennedy might have said, "Ask not what your RainBOW can do for you, ask what you can do for your Rainbow."

> Timothy Neihouse
> P.O. Box I22
> Beatty, NV 89003

## Moving to a Hard Drive

Editor:
I have spent countless hours trying to install a variety of games and utilities on my CoCo 3's 10-Meg hard drive. Most have worked with only a few modifications, but some are just too stubborn. Can someone help me out? The problem programs are Suh Battle Simulator (Epyx), Laser Surgeon (Activision), Flight Simulator II (subLogic), Donald Duck's Ployground and Winnie the Pooh in the Hundred Acre Wood (Sierra On-Line), and finally Multi-Vue (I can't even get it to recognize the hard drive as a floppy-based program).

With all the time I've spent on this, I also
discovered something of interest: Interbank Incident and Mickey's Space Adventure will work on a hard drive under OS-9 Level II if you use a Level I boot disk. It is really handy not to have to flip through all those disks!

Finally, why do some of my games that use artifacted colors display the color green instead of red (when I press F1-Reset)? Is a chip frying out on me? This began happening only a month or so ago. My system includes a 512 K CoCo 3 , an MPI (not upgraded), a Magnavox 8CM-515, two DSDD $51 / 4$-inch drives and a $10-\mathrm{Meg}$ hard drive.

Jeffrey Hess
1305 Lawe Street-Lower
Green Bay, WI 54301
We're not quite sure where the problem is, but our first suggestion is that you play with the Color and Hue controls on the Magnavox monitor. It is very easy to get some "unusual" color combinations if these controls are little out of adjustment.

## Looking for Continued Support

## Editor:

Last December I received a CoCo 3. I was so pleased with its performance that I upgraded it to 512K. My shock came when I learned that this excellent machine has been discontimued by Tandy.

I need your help in finding materials (software, hardware, etc.) that will work with this system. I have been looking through my copies of THE RAINBOW and tried to contact the various merchants I dealt with for my CoCo 1. The majority of my letters are either returned or I am receiving responses that the companies are out of business. Would you please let me know who I can contact that is still offering services for this system.

John Maes
1789 Terrace Heights Lane Reno, NV 89523

As you have found, many past advertisers and vendors of CoCo products are no longer in business. This unfortunate situation is what makes communication through such sources as THE RAINBOW and Delphi so important-there are many others out here who might be able to help. You should be able to contact any current advertiser, and users on Delphi may be able to point you in the direction of vendors who don't advertise in THE RAINBOW.

## Stop the Presses

Editor:
Thank you for the information, programs and general assistance your magazine has provided me over the last 10 years. Although I'm not too crazy about your recent change to the tabloid format, THERAINBOW is still very useful.

Since first getting into OS-9 about two years ago, I have been trying to figure out how to send printer codes to my DMP-107 from within OS-9. I recently discovered a simple command, display, that solves this problem. I'm sure experienced OS-9 users are already aware of this, but those who are still experimenting may find it useful.

To use display, enter the command followed by the various codes you want to send to the printer (to change fonts, styles, etc.), then redirect the output to the printer. The printer codes you want to seud must be entered in hexadecimal format. For example, the following command changes the DMP-107 to elongated print:
display lo e >/p
where 1 b is Hex for 27 and e is Hex for 14.

The $>/ p$ string tells OS- 9 to send the output of this command to the printer.

I hope this information is useful to those readers who are still learning how much power they have with OS-9 on their CoCo.

Eugene Wilkinson, Jr.

Machesney Park, IL 61111

## Dynacalc sans Linefeed

Editor:
Thanks for providing the patch to Dynacalc for eliminating the extra linefeed (May 1992, Page 2). Is there also a patch that would allow me to use the High ResoIution Ioystick Interface from Tandy?

John French
1619 Court Street
Redding, CA 96001

THE RAINBOW welcomes letters to the editor. Mail should be addressed to: Letters to Rainbow, The Falsoft Building, 9509 U.S. Hwy 42, P.O. Box 385, Prospect, KY 40059. Letters should include the writer's full name and address. Letters may be edited for clarity or to conserve pace.
Letters to the editor may also be sent to us through our Delphi CoCo SIG. From the CoCoSIG> prompt, enter RAI to get to the Rainbow Magazine Services area of the SIG. At the RAINBOW> prompt, enter LFT to reach the IETTERS> prompt. then select Letters for Poblication. Be sure to include your complete name and address.

## POKE

When writing educational software, it is important that your creations be as "goofproof' as possible. There are several pokes that, when used on a CoCo 3 for a 64 K CoCo in the all-RAM mode), can help with this. To disable the CLEAR key, especially when a program is asking for user input, use POkE 41893,0. To restore CLEAR-key operation to normal, use POKF 41893. 129. Similarly, to keep SHIFT-Backspace (SHIFT-left anow) from erasing the entire current input line, use POKE 41909.0. To restore this, use POKE 41909,21.

Again, these pokes require that the CoCo on which they are used be in the all-RAM mode. Since the CoCo 3 is always in the allRAM mode, this isn't a big problem for those users. Owners of 64 K CoCo 1 and CoCo 2 machines can use the following short program to put their computers in the all-RAM mode prior to issuing the above pokes:

10 ROMRAM
20 CLEAR 999
30 DATA 26.80.190,128,0.183.255.
222.165. 128

40 DATA $183,255,223,167,31,140,2$
24, 0, 37, 241,57
50 FOR I=1 TO21: READAS:A5-AS+CHRs
(A) : REXT I
(A) : NEXT I

60 P-VARPTR(As) +1
70 POKE P. 126
80 EXEC P
90 PRINT"BASIC IS NOW IN RAM"

## Feature Program

## To Hex With Decimal

While working with the Color Com－ puter，I often need to convert num－ bers from the decimal（base 10）numbering system to hexadecimal（base 16）．In the direct mode under Disk BASIC，this is easy to do using PRINT HEX $\$(x x x)$ ．However， while a program is running，converting numbers isn＇t so simple a task．And now that I also use OS－9，it is even more of a bother．I wrote Hex Chart to end the frustra－ tion．
Hex Chart is a short BASIC program that prints a handy decimal／Hex conversion chart on paper．Though you may still oeed a pencil and paper for some simple math，the printed chart facilitates conversions．Hex Chart requires 16 K and Extended Basic， and the program is designed to work with any standard printer．If you have a CoCo 3 and want Hex Chart to print to the screen instead，change all PRINT非－2，statements to PRINT and set the screen width to 80 columns．［Editor＇s Note：While you can change Hex Chart to print to the screen，a more efficient approach would be to run a stand－alone conversion program such as presented in＂Base Conversions＂（July 1992，Page 4）by George Quellhorst．］

Now let＇s look at how to use the printed chart（see Figure 1）to convert numbers．As an example，we＇ll convert the decimal number 46,253 to hexadecimal．First，find on the chart the highest number that is equal to or less than the original number．In our
example，the number on the chart would be 45，056，which appears in Column 4 and has the Hex digit \＄B to its left．Now subtract the decimal number on the chart from the origi－ nal number．In this case，the difference is 46，253－45，056，or 1197．Again refer to the chart，this time looking for the highest number that is equal to or less than this difference．The decimal value 1024 in Column 3 fits this，and the Hex digit to its left is $\$ 4$ ．

Again subtracting the chart number from the number we are converting（1197－1024）， we find a difference of 173 ．Going to the chart，we find the highest number equal or less than 173 is 160 in Column 2，giving us aHex digit of \＄A．The final difference，173－ 160 ，is 13．This number is in Column 1 and correlates to the Hex digit \＄D．So the deci－ mal number 46,254 is the same as $\$ B 4 A D$ ．

Note that the columns from which we take our hexadecimal digits directly repre－ sents the position of the digit in the con－ verted number．When converting a number that exactly matches one in Column 2，3， 4 or 5 on the chart，don＇t forget to add the significant zeroes．For example，in convert－ ing 32,768 from decimal to Hex，you＇ll find this number in Column 4 with a Hex digit of \＄8．After subtraction，we are left with zern． So you need to put three zeroes（for col－ umns 3,2 and 1 ）after the $\$ 8$ ，giving a final converted value of $\$ 8000$ ．
The chart printed by Hex Chart is also
very useful for converting numbers from hexadecimal to decimal．Simply reverse the process．For example，starting with \＄12C，you would look up the decimal equivalents in the appropriate columns for each of the Hex digits．These numbers，in the correct position，are 256,32 and 12. Now add the numbers together to get the final result，decimal 300.

Steve Ricketts is a mainframe computer operator for a firm in the Portland area． Steve＇s greatest CoCo interests are graph－ ics and telecommurications，and he is now beginning to delve into the world of OS－9 He and his wife Debbie are the proud par－ ents of three daughters．He can be con－ tacted at P．O．Box 1048，Fairview，OR 97024．Please include an SASE when re－ questing a reply．

$S$cramble is a guessing game designed for any CoCo with at least 16 K and Extended BASIC．It is the first game I wrote for the CoCo ，and despite its simplicity，is actually quite enjoyable．

When you run Scramble，the computer picks a string of three letters．The object of the game is to guess the sequence the computer has picked．Make your guess by typing three letters and pressing ENTER． The computer then compares your guess to the three－letter string it picked and tells you how close your guess is．It does this by printing a string consisting of X ＇s，＠＇s and ＊＇s．An X indicates the letter you guessed for that position is correct and in the right position in the computer＇s scramble．An＠ means the letters is in the scramble but in another position，and an＊means it is not in the scramble at all．

As written，you have 20 attempts at guessing the computer＇s scramble．This number is set by the statement If $G G=20$ in Line 140．You can change the number of guesses allowed by changing 20 to another number．Another modification you might try is to have the program reduce the num－ ber of guesses allowed after each time you correctly guess a scramble．Whether or not you modify the program，I hope you have fun with Scramble．

Trevor Boehm is a tenth－grade student whase greatest passion is challenging computers with new programs．He has participated in several science fairs and has received numerous awards for his work． He can be contacted at 77 lawood Cres．， Winnipeg，MB R2Y lA2，Canada．Please include an SASE when requesting a reply．

# OS-9 Learns to Count 

W hen writing, it is often important to know just how long your creation is. Count is an OS-9 version of the UNIX we utility, which counts the number of lines, words and characters in text files.

The syntax for Count is:
count [-lwc] [filename] [...]
To use the program, enter count followed by the desired options (if any) and the name or pathlist of the file for which you want the count. As the ellipsis (...) indicates, you can enter several filenames or pathlists to count many files in one pass.

The options available with Count are shown in Figure 1. You can enter them in any order, together following a single hyphen (-cw) or separately using spaces ( -C
-w). If no options are specified, Count defaults to all three - as if you entered -7w.
$\begin{array}{ll}-1 & \text { count text lines } \\ -w & \text { count words } \\ -c & \text { count characters }\end{array}$
Figure 1: Count Options

When Count goes through a text file, a line is counted each time the program encouuters a carriage returu or linefeed character in the file. A word is considered to be any string of characters that is bracketed by spaces, carriage returns, liwefeeds or any combination of these. The characters counted by Count are the printable characters only and do not include spaces, carriage returns or linefeed characters.

The counts for each file specified are displayed on a single line in the order lines, words, characters and filename. For example, if you enter count myfile, you'll see something like

31314048454 myfile
appear onscreen. If you use Count with multiple files, the combined totals of all the files are displayed following the individual file counts. Entering
count - Tc chapter1 chapter2
results in the following display:

| 313 | 8454 | chapter1 |
| ---: | ---: | :--- |
| 125 | 3068 | chapter2 |
| 438 | 11522 | total |

If you don't specify any filenames ou the command line, the standard-input path is used and Count accepts text from a pipeline or by input redirection. For example, you could enter

## list filel file2 ! count -1

to count the total number of lines contained infilel and file2 together. The outpnt of the list command is "piped" through the Count utility.

If you don't have an OS-9-based assembler, use the BASIC09 program in Listing 2 to
generate the executable Count program. Those using OS-9 Level I also need to change all occurrences of /dd to /do (or another appropriate drive) in the BASIC09 listing before running it.

Stephen Goldberg is a dentist and the author of the Utilipak series of OS-9 utilities. He can be contacted at 695 Plainview Road, Bethpage, NY 11714 . Please include an SASE when requesting a reply.

## Product Review

## Bible Programs and Instructional Programs: The CoCo Schoolhouse

Educational software offerings have become fairly limited in the current CoCo market, so when one comes along, it is usually picked up quickly by those who are looking for this type program. Sebastian LaSpada's newest products, Rible Programs and Intructional Programs, should prove to be no exception. Each of the two products is a cohesive package of related programs designed for education. In the case of Bible Programs, obviously the teaching is of a religious nature. The programs supplied in the two packages work with any CoCo with at least 32 K .

Bible Programs comes on disk and contains several Bible quizzes and two adventure programs. Following is a brief description of the included programs:

Bible Scriptures: displays a short verse (or two) from the Bible-you must supply the appropriate book, chapter and verse numbers for the given verse. Supports over 50 questions.

Bible Scriptures (multiple choice): works just like the program above but is presented in a multiple-choice format. This version supports 70 questions.

Bible Questions, Part I: provides 80 multiple-choice questions of a general nature (books of the Bible, locations, events, etc.).

Bible Questions, Part 2: provides 60 multiple-choice questions about people in the Bible and events in their lives.

Bible Questions, Part 3: offers 50 questions (also multiple-choice) of a "who said these words" nature.

The Promised Land: a text quiz/adventure based on the 40 -year journey of the Israelites from Egypt to the Promised Land. You are asked to answer questions about the joumey, and you must answer each question correctly to visit the Promised Land. A wrong answer takes you back to the beginning of the adventure. You'll probably need a map of the Israelites' journey to snicceed - snch a map is printed in the back of most Bibles.

```

A Bible Adventure: a text adventure that will take you through many scenes and events in the Bible. The program follows the standard text-adventure format, supporting two-word commands and singleletter directions (though two supported commands not found in most other adventure programs, PRAY and STUDY, will be helpful). A map and clue set is available from Sebastian LaSpada for $\$ 3$.

Intructional Programs offers software of a more general educational nature. Included are:

Vocabulary: given a brief definition, you must select the correct word from a list of four. This multiple-choice quiz is very similar to Readers Digest's "It Pays to Enrich Your Word Power." Includes 100 questions.

Math Quiz: presents 10 -question rounds in your choice of five areas: addition, subtraction, multiplication, division and the times tables. Supports four levels in each area.
Homonyms: displays a sentence with a blank, which yon must fill using one of two words that are homonyms (e.g., dear and deer). Supports 100 questions.

Spelling: in an interesting twist, this program works just like homonyms except that the two words are not homouyms. Rather they are the same, though one is misspelled. The program often supplies clues to the correct spelling when the user chooses an incorrectly spelled word.
Guess the Computer's Number: guess the number (from 1 to 100) that the computer has picked. This program is intended to teach relationships between numbers. Unfortunately it exhibits a confusing inconsistency: When I guessed 50 , I was told "That is too small!" I then guessed 75 and was told "You're almost there!" Sol guessed 85 and got "Still too big, but closer!" Since I thought I was coming up on the chosen number from below, I was surprised to see the word still in that last message. Where did I go wrong? Was 75 the first "too big" quess, or was it 85? (The chosen number in this case was 72. )

All the programs in the Bible Programs and Instructional Programs packages nse sound and video for an effective presenta-
tion - correct answers are rewarded with a flashy block-graphics display. In addition, when an incorrect answer is entered, the programs provide the correct answer, which I think is an important part of the learning process.

Though they enhance the presentation of the programs, I sometimes felt the sound and visual effects were a little overdone. It takes a while for some of them to stop before you can move on. I was especially annoyed when I thought the programs were waiting for me to press a key, only to find out they iuterpreted that keypress as my next answer, causing me to miss a few questions accidentally. To the author's credit, this is explained thoroughly in the manual, but it is hard to get used to in practice. Perhaps the displays could be shortened, or the author could alter the programs to ignore any keystrokes until they are requested.

An important aspect of educatioual programs is their ability to be modified as the needs and educational level of the user increases. With the exception of Math Quiz and the two adventures, it is possible to modify the questions and answers in all of the above programs simply by changing DATA statements. Though the formats of the DATA statements are not explicitly covered in the manual, it should prove to be fairly easy for anyone with a basic understanding of BASIC to alter them.

The material presented in these two packages of edncational programs is appropriate for users in and beyond the gradeschool level. Even many adults will be challenged, especially by the two Bible adventures.

All in all, Bible Programs and Instructional Programs are well-designed and easy to use. I recommend them for anyone interested in the study of the Bible and/or traditional education. Both packages are very reasonably priced, allowing even those with a modest income to take advantage of them.(Sebastian LaSpada, 531 Main Street, Dunkirk, NY 14048, 716-366-5261; Bible Programs, \$12; Instructional Programs, \$10; together, \$19.)

## Submitting Material To Rainbow

Contributions to THE RANBOW are welcome from everyone. We like to run a variery of programs that are useful, heipful and fun for other CoCo owners.

WHAT TO WRITE: We are interested in what you want to tell our readers. We accept for consideration anything that is wellwritten and has a practical application for the Tandy Color Computer. If it interests you, it will probably interest lots of others. However, we vastly prefer articles with accompanying programs that can be entered and run. The more unique the idea, the more the appeal. We have a continuing need for short articles with short listings. These are especially appeating to our many beginners.

FORMAT: Program submissions must be on tape or disk, and it is best to make several saves, at least one of them in ASCII format. We're sorry, but we do not have time to key in programs and debug our typing errors. All programs should be supported by some editorial commentary explaining how the program works. We also prefer hatedikrial copy be included in ASCI format on the rape ordisk using any of the word processors lapently available for the Color Computer Also please include a double-spaced printout Also,pleserial ander prial of your editorial material and program listing Do not send text in all capital letters; use upper- and lowercase.

COMPENSATION: We dopay for submissions, based on a number of criteria. Those wishing remuneration should so state when making submissions.

For the benefit of those wanting more detailed information on making submissions, please send a self-addressed, stamped envelope (SASE) to: Submission Guidelines, the randeow, The Falsofi Building, P.O. Box 385 , Prospect, KY 40059. We will send you comprehensive guidelines.

Please do not submit material currently submitted to another publication

## stonr' Plug ' n' Go for Your CoCo!

## stanr NX-1020

This CoCo compatible NX-1020 system sets new standards in color printer performance... 225 cps , 4 NLQ fonts including Script, plus a high speed draft font; but the enhancements don't stop there. Add a 16 k bulfer, a special quiet mode, top feed, botlom and rear tractor, and the list goes on. Seven on-demand colors, 8 color graphic modes, Epson and IBM emulation for maximum solfware compatibility. Virtually everything desired in a printer is here - speed, color and versatility at an affordable price with a 2 year warranty.
Our Plug'n'Go for the Coco system includes:

- NX-1020 Multi Font Color Printer
- Blue Streak Ultima
- Software Support Disk
- Color Graphics Utilities

\$10 Shipping \& Irsurance

This CoCo compatible NX-1001 system is fully featured with 4 NLQ plus a draht font, 10 character sizes from subscript to quadruple size, 4 k buffer, 180 cDs , friction and tractor feed, and much much more. Backed by a 2 Year warranty. Epson and IBM emulation modes for maximum software compatibility. A performer so versatile you may never exhaust it's creative possibilities!
Our Plug'n'Go for the Coco system includes:

- NX-1001 Multi Font Printer $\$ 1888$
- Blue Streak Ultima
- Sottware Support Disk
- Software Support Disk +sio Shipining insuanares STAR 24 WIRE PRINTER SYSTEMS ALSO AVAILABLE! CoCo compathle • Color and Monochrome •Call for pricing

The Ultimate Serial to Parailel Interface!

## The Blue Streak Ulitima

7 Switchable Baud Rates - 300 thru 19200!

- An interface cable that converts the serial output of a $\mathrm{CoCo} 1,2$ or 3 to a standard parallelformat, compatible with modern parallel printers. Connecting the Ultima is as easy as plugging in the cable! The four pin din plugs into the serial I/O port of your CoCo and the other end, a 36 pin connector, connects to the parallel port of the printer.
The Ultima is powered with the +5 V supplied by most printers on pin 18. If your printer does not have +5 V on pin 18 you'll need to add the power option when ordering.

# EDT Change Mode 

I described how to use EDT in its command mode a few months ago. This month I'll describe how to use EDT in full-screen mode on Delphi. First let me remind you how to set up for full-screen editing. Type /ECHO HOST to set yourself up and /ECHO ECHO to restore the defaultecho setting. You can, of course, make a permanent change of your echo setting in the settings menu.

When you enter EDT and see the prompt, type C (short for change). You are now in full-screen edit mode. If your terminal program is set up for VT100 emulation and you have told Delphi in the settings menu that you are on a VT100, and if your terminal program can emulate the VT100 arrow keys, then the arrow keys will move you around the screen just as you suspect. There are also special functions available through the VT100 keypad. If your terminal program can emulate a VT100 keypad PF2 key, then pressing this key displays a help screen. Of course, this will also work if you have an actual VT100. VT52 emulation (or a VT52) also allows you to use the fullscreen editing mode.

The keypad keys allow you to cut and paste blocks of text, lines, words and characters. PF1 is called the gold key - pressing it before certain keys changes the key's function. For example, PF4 cuts a line, and Gold PF4 pastes that line. To use Gold PF4, press PF1 then PF4. The help screen displays the function of each keypad key.

Once you finish editing, press CTRL-Z to get to the normal EDT prompt. Of course you can switch back and forth between line mode and change mode as often as you want. From the prompt, enter EXIT to leave the editor, just as you normally would.

Random Information
Over the past year, several people have sent various hints my way, hoping they would help other Delphi users. In no particular order, here are several hints.

Mike Dalene (MDALENE) pointed out that using the command FILE FORUM. TXT NEW in Forum puts all new messages into your workspace in the file FORUM. TXT. This commaud does not update your high-message pointer, so you need to use the HIGH command in Forum. You could alternatively just read the last message by entering 999999 (or some other absurdly large number), and then exit Forum. Either method sets your high-message pointer to the last message in Forum, preparing you to do this again the next time you log on. After the FILE command, you can go into your workspace and download the file using your favorite protocol. Don't forget to delete the file - conserve storage space!

Frank Hogg (FHOGG) suggested his own useful Forum command: READ NEW NS FOLLOW LIMIT 12. Let's look at this command one part at a time. READ NEW is simple to understand. The next part. NS, is short for nonstop and instructs Delphi to list all chosen messages without pausing at each page or between messages. This is useful when you can capture to memory or to disk, allowing you to capture all new messages and then read them offline. FOLLOW means you want to follow threads; thus, you won't see the messages in numerical order. Following threads can help you keep track of the discussions you are reading if you $\log$ in occasionally. Finally, LIMIT 12 is useful if you don't generally like reading very long messages. You will see only the first 12 lines of messages longer than 12 lines. Delphi adds an extra liue of ellipses (...) to messages longer than 12 lines to indicate that you saw part of the message.

Many months ago, I mentioned that any line in a forum message beginuing with .! is a comment that wouldn't be seen by people reading the message. Jason Bucata (IBUCATA) reminded me that people who type IZDOTS will see these lines! This command turns off the Delphi formatter and shows you all dot commands. Use / NOZDOTS to enable the formatter.

Jason also wrote that /ENT * shows you the names of the last 10 people to enter the SIG, as well as the time at which they entered.

Michael Wright (MIWright) sent me the following message in Mail:

About four to five weeks ago, we had some thunderstorms in this part of Texas and I never thought about disconnecting my modem from the phone lines (nor any of my telephones). I have since replaced my modem and three telephones. You may want to remind your readers of possible hazards to avoid the same.

April Uploads
Shortly after finishing the database reorganization, Greg Law (GREGL) uploaded Alpha Directory - a preliminary list of all files in the OS-9 SIG databases and their full description. Note that this upload is in the . ZIP fonnat, so you need an unzipping program to dearchive it; it is also very large.

Shawn Driscoll (EARTHER) released mdir for OS-9/6809 that works similiarly to the OS-9/68000 command of the same name. Darren Kindberg (DKINDBERG) updated his calendar program for MultiVue. Wes Gale (WESGALE) wins this month's busy uploader award! Among other contributions are Junk - a safer delete utility that copies deleted files to a scratch area where you later delete them yourself (the files are not deleted). If you have deleted something accidentally, you can easily retrieve it. His cdir utility allows rapid searching for files using wildcard characters. Xarc makes it easy for you to extract files from an archive of almost any type without having to remember the command-line options of each dearchiving program. Wes also uploaded a demo version of a fast bootfile editor for OS-9/6809. Finally, he nploaded a bundle of RiBBS utilities. Jim Martin's (WOAY) latest gsort is compatible with undel and RBF Edition 30.

Rick Adams (RICKADAMS) released Version 4.2 of his UUCP package. This release adds new features and fixes some bugs. Eddie Kuns (EDDIEKUNS) contributed the latest updated clock modules for the OS-9 software clock and the Burke \&

Burke and Disto real-time clocks. These clock drivers are based on the work of Bruce Isted (BRUCEISTED) with additional help from Tim Kientzle (TIMKIENTZLE). If you are having trouble with dropped characters or terminal programs hanging, this clock driver may fix your problems. It correctly diddles the GIME to ensure that no interrupts are lost.

If you want to test your disk-drive speed on an OS-9/68000-based system, Mark Griffith's (MARKGRIFFITH) DDTest should be helpful. It tests read and write speeds as well as track-to-track and average-seek rates. John Wainwright (JOHNREED) uploaded a port of the popular TeX typesetting language including a previewer that should work with K-Windows. Mike Haaland (MIKEHAALAND) released AAP1ay - a K-Windows program that displays AutoDesk Animator . FLI and . FLC animations.

Don Vaillancourt (DONVAIL) uploaded the latest version of his OS-9/68000 graphics and sound standards proposal.

If you are feeling politically active but don't know how to get your message where it will do some good, you will be interested in Don Hutchison's (DONHUTCHISON) upload. This file lists all Congressfolk and their fax numbers. Now all you need is access to a fax machine! Don also contributed a file full of lawyer jokes. Brian Flahive (BFLAHIVE) released Easy Reader, which allows you to easily read .DOC and .TXT files.

Eddie Kuns is pursuing a doctorate in physics at Rutgers University. He lives in Aurora, Illinois, and works as a programmer and researcher at Fermilab. Eddie is the OS9 Online datahase manager; his username is EDDIEKUNS.

It is often desirable to know how many characters a user has entered in a string after an INPUT or LINEINPUT statement is executed. One way of doing this is to use the LEN (length) function (e.g., $A=L E N(A \$)$ ). Another way is to use a peek. Memory Location 425 contaius the length of the most recently entered string; to get this information, use $\mathrm{A}=\mathrm{PEEK}$ (425). This latter approach may be just a bit faster than the first.

Have you written an interesting utility program for use with your CoCo ? Perhaps others would find it a useful addition to their libraries, too! We are now making tentative plans for the January 1993 issue of THE RAINBOW and are accepting submissions appropriate for that issue's theme, Utilities.

We welcome submissions for BASIC as well as OS-9. All submissions intended for the January 1993 issue must be received by us no later than September 25, 1992, and must follow our standard submission guidelines (see Page 9 for details and address).

We'd also like to see any other programs you have written (submitted material must be the original work of the submitting party, or submitted with written permission). All submissions are evaluated and considered for publication in future issues.

BACK ISSUES STILL AVAILABLE Have yos explored the wealth of information in our past issues? Fram our very first, fourpage issme to anany with more than 300 pages of material, it's all just for Coco usets - a great way to expand your library!

## A WORLD OF INFO

AT A BARGAN PRICE
All buck issues sell for the single issue zover prise. In addition, there is a $\$ 350$ chatge for the first issue, plas 50 cents for each additional iscue for postage and handting if sent by

Unied Parcel Service. There is a $\$ s$ charge forthe firstissue, plus as $/$ charge for cachadditional lisue on orders sent by U.S.Mail UPS will rot deliver to a post office box or to atrother country.
MOST ISSUES STILL. AVAILABLE: Available rssues throagh lone 1982 are provided on white paper in a reprint form. All others are in regular magazine form. VISA. MasterCard and American Express accepped. Kentucky residents please add 6 percent sales tax: Cinadian residents. 7 percent CST in
order to held down cosis, we do not bill. and no C.O.D. orders are acceepted.

Due to heavy demand. we suggest you arder the back issuen you wan now while supplies last.
To order. review and fill out the form below and mail it with your payment

For greater convenience, order through the Rainhew Magazine Services atea of our Delphi CoCo SFG.

## RAINBOW INDEX

A complete index for, July 1981 through June 1984, is printed in the July 1984 issue. Separate copies are available tor $\$ 2.50$ plus $50 ¢$ handling. Indexes for subsequent years are published annually in the July issues of THE RAINBOW.

Article Reprints
In instances where a given issue is now out of print and not available for purchase, we do provide photocopies of specific arlicles. The cost for this service is $\$ 1.50$ plus 50 cents $\mathrm{S} / \mathrm{H}$ per article. This service is provided only in the case of out-of-stock issues.

Updating Submission Information
THE RAINBOW has received literally thousands of programs and articles over the ycars. Obviously we can't publish all of them immediately, so we often hold them for possible publication in later issues. Unfortunately, some of the better submissions are being held because the authors have moved without notifying us of their new addresses.

If you have submitred a program in the past, then moved. please take a few minutes to send us a note with your new address and phone number. Or if you know of someone who fits this description and does not currently read THERAINBOW, please have them contact us. Our address is the rainhow, The Falsoft Building. 9509 U.S. Hwy 42. P.O. Box 385, Prospect, KY 40059. Send updates to the attention of the Editorial Department.

## Received and Certified

The following products have recently been received by THE RAINBOW, examined by our staff and issued the Rainbow Seal of Certification, your assurance that we have seen the product and have ascertained that it is what it purports to be.
CF83-9: Graphic Set, a word set thar allows PMODE graphics use through CF83 Forth (required. purchased separately). Supports all PMODE commands (though they are named differently) for creating, manipulating and viewing graphics on the $\mathrm{CoCo} 1,2$ or 3 . BDS Software, P.O. Box 485 , Glenview, IL 60025-0485. (708) 998-1656; \$28 with printed manual, $\$ 15$ with manual on disk; Canadian orders add \$3, all other foreign orders add $\$ I O$; all funds U.S.

CoCoCassette \#117, a variety of programs for the $\mathrm{CoCo} 1,2$ and 3. This issue includes Boxes, an arcade-type game; Tic Tac Toe 3, for the Color Computer 3; Мenu, a diskbased menuing system; Muncher, a simple text-based PacMan play-alike; Riddle; LottoGME, a personal lotto game; HCopy, a utility for saving graphics images to unused RAM for later use; Rahul's Quest 3, a joystick-based CoCo 3 adventure; Cars Typing Tutor, a typing tutor with a twist; and Protect, a Tom Mix game. $T \& D$ Subscription Software, 2490 Miles Standish Drive, Holland, MI 49424, (6I6) 399 9468; $\$ 8$.

CoCo Font Pro, a utility for creating, editing, saving and displaying text (using HPRINT) in different fonts on the CoCo 3 Hi-Res graphics screens. Fonts included are normal, normal inverted, picture, script, fancy, outline and bold. Extra fonts are available. Color Computing Software, 65 Oak Road, Canton,MA 02021; $\$ 14.95$ plus \$I SIH.

Life and Death, the game of Life for one or two players - play the game instead of simply watching it. Written in CF83 Forth. Requires at least 64 K , one disk drive and a color monitor (RGB or color composite) or color television. BDS Sofnvare, P.O. Box 485. Glenview, IL 60025-0485, (708) 9981656; $\$ 10$ with printed manual; Canadian orders add \$3, all other foreign orders add \$10; all funds U.S.

The Rainbow Seal of Certification is open to all manufacturers of products applicable to the Tandy Color Computer, regardless of whether or not those companies achertise in THE RAINBOW. By awarding the Seal, we certify the product existswe have a sample copy and have examined it. However, this does not constitute any guarantee of satisfaction. As soon as passible, these products will be forwarded to reviewers for evaluation.

by－11 grid，the bottom four rows of which

are filled with playing pieces of different colors．The object is to move all 16 pieces as close to the top of the grid as possible． The closer you get，the more points you score．Ordinarily this goal would not be too difficult to achieve．However，let＇s take a look at Uptop＇s operation and rules．
To move，position the flashing cursor over the desired piece using the joysticks and press ENTER．The selected piece moves upward the same number of rows as there are pieces in the original row（no piece can move horizontally or diagonally）．For ex－ ample，if you choose a piece in a row with three pieces，the selected piece moves up three rows．The three rules governing your moves are as follows：

喓 the square into which you intend to move the selected piece must be vacant，
${ }^{3}$ a piece may not ${ }^{-}$ be moved into a row that already contains a piece of the same color，
wis and the top－most piece on the grid at any time may not be moved one square upward．

Given these rules，we expect you＇ll find Uptop to be quite a challenge．Points are
 scored only when the upper blocks are occupied； 560 points is a perfect score．The game automatically ends when you can－ not make a legal move or when all the pieces are in the top four rows．Press $Q$ at any time to quit or start a new game． Good Luck！

## BRAND-LABEL DISK JACKETS

Iabeling disks is one of those important computer housekeeping chores that is also sometimes frustrating. The little gummed labels never seem to stick for long - even if they're specially made for disks. I cured this sticky little problem by writing a BASIC program to create my own disk jackets, complete with printed directory.

DJACKET is a short CoCo 3 program that prints a disk-jacket outline using standard ASCII characters. Make sure your printer is online, and run the program. When prompted, put the disk for which you want to create a jacket into Drive 0 . The program reads the disk's directory information as it prints. When it is finished, you can print another jacket or quit.

After you remove the printed paper from the printer, use scissors to cut around the extreme outer portion of the outline. Then fold the form on the three lines indicated in Figure 1. Use a little transparent tape (or glue, if you want) to attach the flaps to the back side of the jacket, and you're ready to go.

The control codes DJACKET uses to

## Feature Program

## Driller of the Times

(ath Driller is designed as a teaching aid for the standard multiplication tables. The program works with any CoCo having at least 16 K and Extended BASIC.

Math Driller works much like flash cards -multiplication problems are displayed in rapid succession onscreen, and the student must enter the correct answers. If the stu-
dent takes too much time entering an answer or doesn'tenter the correct answer, he is informed (with a little sound help from the PLAY command) that he needs to prac
tice more. If you (or your child) is having problems with times tables, give Math Driller a whirl.

Trevor Boehm is a tenth-grade student whose greatest passion is challenging computers with new programs. He has participated in several science fairs and has received numerous awards for his work. He can be contacted at 77 Inwood Cres., Winnipeg, MB R2Y 1A2, Canada. Please include an SASE when requesting a reply.

High-Speed Crystals? I've heard various reports on Internet offolks accelerating the speed of their CoCo 3 by dropping in a higher speed crystal. Specifically, one person reported some degree of success replacing the 28.63636 MHz ( $8 x$ Colorburst frequency) crystal used in the CoCo 3 with a 32 MHz crystal. What are your thoughts about this?

Art Flexser (ARTFLEXSER)
Miami, Florida

AI will stick to the position I took in an earlier "CoCo Consultations" column: Increasing the speed of the clock crystal is a foolish pursuit, of interest only to the most fanatic of hackers. Yes, Dave Macias reports successfully getting a CoCo to work with a 32 MHz crystal. But he also acknowledges that at that speed he no longer can get the video image to sync with his Magnavox 1CM135. He was able to persuade a monochrome monitor to sync at the increased sync speed by twiddling with its horizontal sync adjustment. It's possible that if he messes with the ferrite slug on the horizontal sync adjnstment in the 1CM135 (assuming the 1CM135 has a standard horizontal sync adjustment internally), he might yet get his CoCo to sync to it. However, even if he does, the image will likely be somewhat distorted. Note that all you are getting when you change to a 32 MHz crystal is a roughly 10 percent increase in actual computer speed, from about 1.9 MHz to about 2.3 MHz actnal cycle speed. In my opinion this is hardly worth the risk of unreliable operation and the video problems it causes. Dave's report is of intellectaal interest bnt not of any practical significance for those who want to increase the speed of their CoCo 3.

High-Speed 6809s?
I've heard that there exist high-speed versions of the 68B09E chip rated up to 8 MHz operation. Is there any way I can use such versions in a speeded-up CoCo3? How else can I increase the speed of my CoCo 3? What's involved in putting a CoCo 3 inside a tower case?

Wayne Thompson (WTHOMPSON)
Sachse, Texas

AAs I noted above, it is not feasible to increase the clock speed of the CoCo 3 more than a tiny bit without running into serious problems involving the memory access and video display. For this reason, 6809 and 6309 chips rated to run at more than 2 MHz cannot be used at speeds greater than 2 MHz inside the CoCo 3. However, if you are using OS-9, there is one way to increase performance: Consider installing Burke \& Burke's PowerBoost kit. This $\$ 29.95$ kit consists of a Hitachi 63B09E chip and patches to the OS-9 software to take advantage of the expanded and more efficient instruction set of the 63B09E. Chris Burke claims that block moves can be speeded up 400 percent using the 63B09E at the standard 1.89 MHz clock rate with the 63B09E in native 6309 mode. Since any
increase in performance will vary with the program being run, I'm not sure you can expect more than about a 50 percent overall increase in speed running ordinary applications. But this is the only sensible route to boosting your CoCo 3 's speed without compromising the reliability or video display. You do have to have the skill to desolder the existing 68B09E inside your CoCo 3 and replace it with a socket. Burke \& Burke supplies the 63B09E, along with the patches to OS-9 and a book about the 6309 processor.

As for putting a Color Computer in a PCclone case . . .that's the sort of thing that "if you have to ask how to do it, you'd best not try it." I suggest you consider doing it only with direct, one-on-one help from someone locally who has already done this. In a past "CoCo Consultations," I have given explicit instructions on how to hook a CoCo 3 to a PC-compatible power supply. Readers have reported to me that, by and large, these instructions are accurate and that by following them they have successfully connected a CoCo to a PC power supply. I made one minor error in those instructions: I stated that hooking up the 78L08 to power was required only for CoCo audio. This is not correct. You need power at the 78 L 08 in the CoCo 3 not only for audio but also for composite video.

## WEFAX Updates

In the August 1990 "CoCo Consultations" you mentioned there was an update to the WEFAX program appearing in the February 1985 issue of Rainbow. How can I obtain such an update?

Ellis Cornell
Dearborn, Michigan
If you send me $\$ 10$, I will send you all of the latest material I have for WEFAX, RTTY and a quality CoCo-based Morse Code practice program. These updates have not changed in the last three years, I should note. They do include printer drivers for most older Tandy printers including most of the DMP- 130 series, for older Okidata printers, and for older Gemini printers. Also included is a send and receive version of WEFAX that has been used to transmit weather maps to ships at sea. The package includes an updated version of RTTY for the CoCo that supports several different baud rates and allows transmission of previously prepared and saved ASCII files, and saving of incoming text to disk as an ASCII file. You can contact me at 1633 Bayo Vista Ave, San Pablo, CA 94806.

## Spare Motherboards

(How can I get a spare working motherboard for a gray-case CoCo I, Tandy Cat. No. 26-3003A?

John L. Van Winkle Wickenburg, Arizona

Tandy no longer stocks CoCo 1 or 2 motherboards. Even when they did, such things were not at all economical to purchase from Tandy. In big cities, at occa-
sional garage sales and at electronic and ham flea markets, CoCo 1's and 2's sell for from $\$ 10$ to $\$ 25$ each. That is the best way to fix a broken CoCo 1 or 2 .

## Graphics Conversions

Those interested in converting . GIF files to .MGE-type files should be aware that in the CoCo SIG on Delphi is a program called NEWGIF.BIN that allows you to do this.This program has been in the CoCo SIG for a while. Using another converter called MGETOCM3.BIN (also available in the CoCo SIG), you can convert .MGE files to .CM3 format.

John Burke (JBURKE)
Freemont, California

## Downloading With Autoterm 6.3

I'm having problems downloading tokenized BASIC programs and binary programs using Autoterm 6.3. After I save the program and then try to load it, I get an IE Error. The manual is very confusing and ambiguous on this subject.

Charles Wiggins (WIGGINSC) Tucson, Arizona

Charles, the problem you are having is due to a bug in Autoterm 6.3. The file's length is stored as one byte less than it shonld be, hence the IE Error when you try to load it. There is a file in the Telecommunications database of the CoCo SIG on Delphi that outlines a procedure for repairing such a file. Search the database with the keyword AUTOTERM. You will find a file written by Tim Kientzle, based on information supplied by Richard Gonzales (DRIFTY). The fix described is as follows: Use the editor in Autoterm. If you have a version of Autoterm prior to 6.3, use A64 or A32 (not A128 or A512 for they have another obscure bug).

1) Go into Autoterm's text-editing mode, and delete any data in the buffer.
2) Load (SHIFT-CLEAR-L) the faulty file (the one with the IE Error on loading) into the editor.
3) Jump past the end of the file (SHIFTDown Arrow).
4) Press ENTER (or any key).
5) Save (SHIFT-CLEAR-S) the resulting file to disk with a new filename (otherwise Autoterm will append the new file to the old one)
6) After you have determined that your fixed file works, delete the faulty file from your disk to prevent any confusion!

This will add an extra byte to the faulty file, fixing it. This procedure may sound complicated, but it actually takes only a few seconds to do. Thanks to Art Flexser for offering this explanation.

Re-inking Ribbons
What is meant by the description in
Tandy's computer catalog of my Tandy's computer catalog of my ancient LP VII ribbon as being a "re-inking ribbon."

Tom Fann (TOMFANN) Akron, Ohio

Like many other ribbons, the LP VII ribbon has little rollers soaked with ink that rub agaiust the ribbon as it moves in what likely is a continuous and possibly moebius loop, adding extra ink to it as it passes by. Bnt be carefnl! As a ribbon gets used, it gets physically worn and ultimately physically tears, often catching a pin from the print head and destroying the print head. This is anespecially nasty problem with 24 pin printers whose print heads have especially tiny, delicate print pins.

A Full Meg of Memory What can you tell me about I-megabyte upgrades for the CoCo 3? You mentioned you were using one in a previous "CoCo Consultations" column.

John H. Opheim
Burt, Iowa

ADisto/CRC produced a 1MB upgrade for the CoCo 3 . It was a bit tricky to install, requiring soldering a $40-\mathrm{pin}$ header to the 68B09E chip in the CoCo. This upgrade was of use principly with OS-9 (after a minor patch was made) and of little use to Disk Basic users. Sadly, CRC no longer produces it, so it is generally not available. Occasionally CoCo PRO! has used ones for sale, and occasionally one gets offered for sale in the Classified Ads section of Delphi.

## Simply Better in Parallel

I recently purchased Simply Better for word processing. It works fine except it will not print through my Disto parallel printer port. Even ADOS 3 configured for sending output through the parallel printer port does not cure the problem. Is there a way to fix this?

Randy E Longshore (RANDYE) Alta Loma, California Art Flexser tells me that he knows of no patch for Simply Better to allow it to use the Disto Parallel port. Apparently Simply Better does not go through the BASIC ROM call for printer output, and thus ADOS 3 cannot redirect its printer output. However, Art suggests a possible solution: Use the feature of Simply Better that allows you to save the printer output to disk. Then write a two or three line BASIC program that you can run under $A D O S 3$ that prints the file. Just open the file, read a line at a time, and send that line to the printer, then loop back to input another line. Another option for ADOS 3 users is the SCANP command, which will cause the file to be printed.

Martin H. Goodman, M.D., a physician trained in anesthesiology, is a longtime electronics tinkerer and outspoken commentator - sort of the Howard Cosell of the CoCo world. On Delphi, Marty is the SIGop of THE RAINBOW's CoCo SIG. His non-computer passions include running, mountaineering and outdoor photography. Marty lives in San Pablo, California.

If you've ever printed a long document using continuous fan-fold paper, you know how frustrating it can be to remove all the "edgies" or "holes" from the paper. Some people do this by separating all the pages, then painstakingly removing the edgies from each of them.

A better way of removing the edgies is to leave the pages connected and stacked. As long as there are no more than a few pages (seven or so) in a group, removing the edgies takes less time. As an added benefit the stability gained by working with several pages at once helps you remove the edgies more neatly and accrirately.

NMOS (Negalive Metal Oxide Silicon) technology. Chips constructed using NMOS technology are known for being relatively powerhungry, und the 68809 E in the CoCo consumes rearly a tenth of an Ampere, or 100 milliatnps.

Since the 6809 was originally introduced and gairred in popularity, programmers and system designers wanted a CMOS (Complimentary Metal Oxide Silicon) version of the micraprocessor. CMOS technology provides for a tenth the power consumption of an NMOS chip while actively executing code, and a hundredth (or less) the power consumption if put into a "standby" mode. CMOS technolngy ullows for the dexign nf battery-operated systems that, in this case, would ntdinarily nse a 6800 .

Of course CMOS technology is trickier 10 engineer than NMOS, and Motorola initially could not produce such a version of the 6809. When the technology came to a point where making such a version became feasible, it tumed out Hitachi had most experience with such matters. Motorola had previously contracted Hitachi for the production of CMOS versions of some of its other processors, so it was not surprising the company went to Hitachi for a CMOS version of the 6809 , which Hitachi called the 6309 .

Current evideuce leads me to speculate that the engineers at Hitachi approached the problem of making the 6309 in a very different fashion from the original designers of the Motorola NMOS 6809. The original 6809 was latd out using randont logic (which is sometimes referred to iss "hard wired".) In this approach, all machine-lan guage instructions are created by directly using physical arrays of logic elements.

The Motorola 6809 is one of the last microprocessors designed in such a fashion.
In 1977 when the 6809 was being designed, nore and more developers of CPUs were using what is called microcode for chip design. In this approach, a few very simple instructions are actually hard wired inside the processor, and code is placed in permanent ROM within the CPU This code executes parts of the simple insinuction set in order to seem to be executing the actual complex instruction set of the CPU chip.

The microcode spproach makes it much easier to design. debug and modify a central processor chip. In 1977, howcver, it also had one significant disadvantage: Because the actnal instructions had to be created by execnting several instmetions in a more primitive instruction set, a microcoded CPU would take mote machine cycles to executc a particular instruction than would one designed using random (hard-wired) logic. Indecd, it is for this reason that the hardwired 6809 could make much more efficient use of machine cycles than its microcoded competition of the time - that a 2 MHz 68 B 09 E could get things done as fast as other chips of its generation operating at up to eight times the cycle speed.

Nearly ten years passed between the time the Motorola NMOS 6809 wascreated and the development of the Hitachi CMOS version of the chip. (That's an eon in terms of computer-chip development history.) In that time, engineers and chip designers learned a great deal about how to efficiently implement microcode type chip architecture, and they can now make a 6809 -like chip that executes machine-language instructions as efficiently (and more so) as the original 6809 , yet do it using microcode rather than the hard-wired approach.

It seems almost certain that the 6309

from Hitachi was designed using the microcode approach. I suspeci after the engineers at Hitachi finished the microcode to allow the 6309 to perfectly emulate the Molomala 6809, they found there was a lot of space left in the internal ROM. They apparently used this space wisely and added a number of extra registers (see Figure 1 ) and a great number of extra instructions. Support was included for moving data to and from memory fonr times faster than the 6809 could, a l 6 -bit-by- 6 -bit maltiply in a 32-bit product, error trapping, and more.

Eveo thongh Hitachi engineers knew how to make 6809 machine-language instructions execnte using fewer machine cycles than with the 6809, Motorola had asked Hitachi to make the 6309 an exact pin-for-pin, instruction-for-instruction copy of the 6809 . So Hitachi had to makc all 6809 instructions execute in the exact same number of tnachine cycles as they did on the original 6809 . This is important; some 6809 prograns, like WEFAX and RTTY, depend on precise siming, which in tum is governed by instructions exceuting in ecrtain knowu uumbers of clock cycles. Had Hitachi improved the number of cycles for execution of standard 6809 instructions, such programs would cease to operate.

To counter this requirement, Hitachi also built in to the 6309 a native or 6309 mode in which even the 6809 iustructions had been recoded to execute in fewer clock cycles. Chris Barke*s current testing of the 6309 indicates that, on the average. a 6309 execuling 6809 imstructions in the native ( 6309 ) mode executes those instructions about 15 percent faster. When in the native mode, even when running at the same clock speed and executing code that coutains only yalid 6809 instructions, a 6309 executes that code faster than a 6809

When power is first applied to the 6309 . it wakes up in the emulation ( 6809 ) mude in which all 6809-type instructions are executed in the same mumber of cycles as would be with a true 6809 . (Still, this mode suppors the powerfulextra instructions for the extra registers, fast movement of data, and so on. The extra instructions shonld be present in all 6309 chips, even when they are "pretending" to be 6809s.) If the 6309 reccives the proper code. however, it goes into the native mode. It is important to nnderstand these two different ways a 6303 can be used wo tun code faster than a 6809 if you want to fulfy understand what B .ane \& Burke has accomplished with PowerBoost.

## Is the 6309 Legitimate?

Since Motorola had asked Hitachi to makc an exact CMOS version of the 6809 . we can assume they did not want an enhanced 6809 . They simply wanted an exact copy that uses low-power CMOS technology. Although an immense number of enhancements were built into the 6309 they could not be documented or announced because this would violate Hitachi's agreement with Motorola. When the 6309 was released, no one in the U.S. knew of the enhancements Hitachi's engincers bad "secretly" added. Hackers became suspicious when they fund that certain improperly written programs crashed differently on a 6309 than they wnuld on a 6809 . White information was ceventually leaked in Japan regarding the extra registers and instructions iu the 6309. only recently was this information translated and made available to 6809 programmers in the U.S. Indeed, although a hundful of insiders may have had information about the 6309 for a year or more, the vast majority of $6809 / \mathrm{CoCo} / \mathrm{OS}-$ 9 programers in the U.S. learned details of

the extra properties of the 6309 around April or May of 1992, when a document from Japan was circulated on Intemet and Delphi.

One question knowledgeable hardware tinkerers will ask is, "Can we count on Hitachi keeping these extra features in fnture production runs of the 6309 , given that these extra features are not officially documented?" Chris Burke addressed this issue in his seminar on the 6309 and PowerBoost at the Chicago 1992 CoCofest. Chris noted that in order to pull the new features from the 6309 , Hitachi would have to recreate the mask of the chip, costing them a good deal of money. Thus, although there is no guarantee future production runs of the Hitachi 6309 will continue to have the fea-
tures mentioned here (on which PowerBoost depends), it would seem likely that this will be the case. Chris pointed out that the 63 B 09 E is relatively inexpensive. so interested parties might consider buying more than one 6309 to assure continned access to its featnres.
It's also possible that Motorola would get sufficiently upset over what Hitachi did to improve the 6309 that it would institute legal action to prevent the sale of the chip. However, with the 6809 being snch a tiny fraction of Motorola's business, this seems highly unlikely at this time.

One more thing to remember: Since the extra features of the 6309 are not officially documented, I would imagine they are also not tested in quality control at Hitachi.

Thus, it's possible that some production runs of the 6309 will work fine as 6809 's but exhibit problems when used in the native mode or to exceute the extra instructions. This too is a theoretical possibility that 1 think is not all that likely to be a problem in practice.

## The Future?

We've already taken a brief look at the 6309 's performance advantages, but the question as to whether or not the 6309 will catch on as a replacement microprocessor in privately owned CoCos remains unanswered. Further, no one can at this time be certain there are not undiscovered disadvantages (or more advantages) to such
replacement. THE RAINBOW intends to follow this subject closely, and you can expect much discussion of the 6309 to take place in my " CoCo Consultations" column.

Martin H. Goodman, M.D., a physician trained in anesthesiology, is a longtime electronics tinkerer and outspoken commentator - sort of the Howard Cosell of the CoCo w'orld. ## Is the 6309 for OS-9 Only?

To take advantage of the 6309 's features under OS-9 Level II, one need only update the operating system's modules. Because of OS-9`s modularity, performance increases starting at this level are automatically reflected elsewhere - hy applications software. This is not so under Disk BASIC because Disk BASIC software spends most of its execution time in its own code.

Also, the patches developed so far for Disk BASIC use only the emulation mode and are somewhat limited in benefit.

It is possible to take advantage of the 6309's native mode by entering a few simple pokes, and you can gain the beucfit of. perhaps, a 15 -percent increase in throughput. However, unless you also change the interrupt routines in Disk BASIC, the system will crash with any attempt to execute sound functions, send or receive data through the rear serial port or perform disk I/O.

Once sucb patches are in place, though,

## PowerBoost From Cover

patches them. If notes when it finds a module that should be patchable but isn I ( due to the module being different, custom or absent).

The product I saw in Chicago is ready for shiparent, bu is in its infancy. Chris has patches (of course) for the hard disk drivers for the Burke \& Burke $\mathrm{CoCo-XT}$ interface. He says he plans to work on similar patches for the RGB and Disto hard-drive code. Eventually Chris hopes to have patches for other hard-drive systems, for the OS-9 assembler and other aspects of the system. Chris does not at this time anticipate patching the C compiler, but hopes the information he will supply through his soon-to-bereleased book about the 6309 will permit other dedicated programeners to update the C library for optimized use with a 6309.

Most important of all, thee current set of patches use onfy the extra instructions availabte while the 6309 is in the 6809 ernulation mbode. He hopes to have more adyanced patches available in the near future that will take advantage of the native mode. Chris also hopes to have out in the near foture patches to the graphics modules that should massively speed up data transfers performed by them.

Those desiring a power boost for their CoCo 3 OS-9 systems need not, however, wait for the later improvements of the product. Bnrke \& Burke has a very generous policy for apdating old versions of the product with new releases when they are available - the charge is expected to be something like $\$ 5$ for the upgrade.

What exactly does all this translate to in terms of the speed at which work-a-day OS9 application software is execuled? This will of course depend on how much the software youl use makes use of system functions that are speeded up by the PowerBoost patches. Programs that intensively use the hard drive and RAM disk should show Iramatic speed increases, perhaps 50 percent or more. Other programs might not show march noticeable speed increase. Overall, however, hased an my limited look as the product, I am quite convinced that those who instalt PowerBoost will see a significant inctease in the speed of their OS-9 systems.

Whatabout compationity? I suspect that hese patches won't make a system any less compatible with an ordinary OS-9 applicalion. I can imagine some unusual programs that depend on recognizing a byte for byte sequence that PowerBoost las patched resulting in failure when PowerBoost is installed. I donbt this will often be a problem, though. Indeed, should PowerBoost carch on in a big way (as I suspect it will), It is likely that authors of OS-9 application programs will release patches for their applications to further increase the utility of the PowerBoost kit.

## PowerBoost and bastc?

I have so far sidestepped the issue of the 6309's advantages under RASEC. In my opinion, PowerBoost is currently a product solely for OS-9 users, aluhough I have not yet seen the patcies included for Disk BASIC in the PowerBooat lik. Accoording to Chris, the patches he has made for Disk BASIC (at the time of this writing) make only a small speed difference.

A CoCo 3 with a 63B09E instatled will run basic just fine. And in theory, patches similar to those for OS-9 could be made to Disk BASIC the same way ADOS 3 currently patches the system). However, I imagine such patches would be of little significance in most cases because most Disk BASIC software spends most of itstime in its own code and very little time calling Disk BASIC routines. Thus, to effectively use a 6309 with Disk Rasic programs, you'd have to have individual patches for each applicarion program.

Those who wand to experinent with the 6309's native mode under Disk BASIC can try poking the Hex values \$11 \$3D \$01 \$39 into a USER function, then execuring it. Chris Burke says you should see about a 15 percent overall speed increase. However, be sure not to use disk IOO or output to the printer or other serial device via the 4 -pin bit-banger port - the changes in instrucfion cycle counts for the code messes op those functions. Itshould also be possible to significantly oxhance BAsIC graphics programs by rewriting parts of the graphics code in the BASIC ROMs to use the more efficient data-transfer operations of the 6309 .
t should be possible to write machinelanguage programs to fully use the power built into the 6309. In support of this, Bill Vergona (of Cer-Comp, Ltd.) has been working diligently on an assembler specifically designed for use with the 6309 microprocessor. At press-time, Bill said the assembler is 95 -percent complete. He expects it to retail for 559.95 , the same price as CerComp's existing assembler for the CoCol 1 , 2 and 3. Once that project is finished, if enough interest in the 6309 (and software for it) exists. Bill will consider redesiguing
some of his products (specifically CBASIC and Windows) to take advantage of the 6309.

It will be interesting in the coming months to see if other software vendors follow suit, rewriting existing applications and buildiug new ones for the 6309 (we are not currently aware of any others who have already patched commercial products). We imagine this, too, will depend on the amount of interest CoCo users show in the 6309.

## The Hardware Aspect

Replacing the $\mathrm{CoCo} 3^{3}$ s $68 \mathrm{BO9E}$ with the PuwerBoust's 63809 E is not a tivial matter, the 68 B 09 E ehip is soldered d:rectly to the delicate double-sided CoCo 3 circuit board, and replisement irvolves signficamt hardware skill. The PowerBoost instructions detail two approaches to the replacement: desoldering the 68809 E and destructive removal. I prefer the latter approaeth, as a clean removal with an unhasmed PC board is far more easily achieved than with the former approach. [Editor's Note: Storthy hefore thit issue went to press, Chris Burke circulated on Delphi and elsewhere a document describing a shird approach. This method involves piggroacking the socket on the eristing $68809 E$, then installing the 63B.09E. With this tactic, you can choose to torally disable the 6809, or you can install a swich that enables you to select between the 6809 and the 6309 . Best of all, this approach does not require that you renave the exising 6809, though the installalion still requires harchare skills.]
Whichever method you choose, after the 68 B 09 E is removed, you proceed to install the 40 -pin socket included with PowerBoost. Once the socket is installed, you can install the 63B09E and be on your way.

Those fotks with 1- or 2-Meg upgrades wilf have to be especially creative when installing the PowerBoost, as the memory upgrade is already soldered to the 68809E. The quickest way to handle this would be to desolder the memory board from the existing 68 B 09 E chip, install the socket, then solder the the memory board to the 63B09E chip and plog that into the socket.

A far more elegant, reliable and easy-toservice approach would involve constructing a circuit board with a socket on it for the 63 B 09 E chip, with pins coning out from the bottom of the socket onder the PC board in a way that allows them to be plugged into yet another socket. Then bend out the two rows of pins from the memory board that formerly would be soldered directly to the CPU chip and let them stradulle the sacket on the top of your satelite board. Finish by wiring them to each pin of that sacket.

Burke \& Burke sells the Powerliossthit with the current sets of patches for ara-
markably generous $\$ 29.95$. If you are a heavy-duty hacker and have a 63B09E lying around, Burke \&\& Burke will sell you PowexBoost without the 63B09E for $\$ 25$. (Note that $\$ 5$ for a 63 B 09 E is a very reasonablo price, so if you do nor have a $63 \mathrm{B09E}$ ty ying around night now, I unge you to buy it as part of the PowerBoost kit.) In addition, you can purchase extra 63B09E chips from Burke \& Burke for $\$ 5$.
It has been my intent in this review to provide sober solid facts concerning concening PowerBoost. However, I must make a confession: I have for years had the very highest personal regard for Chris Burke. He impresses me as an exceptionally creative and compelent software and hardware designer, and as an outstandingly decent. generous person. I believe his contributions to the Colar Camputer Community have been among the most significant. I urge OS-9 users who are interessed in squeezing greater pewter out of their CoCo 3 OS-9 system to strongly consitict buying PowerBoost. Let's sall sappon ihose who continue to provide new, innovative products for this beloved machine. (Burke \& Burke, P.O. Box 733. Maple Valley. WA 98038, 206 432-1814, 829.95 plus $\$ 4$ S/H.)

- Marty Goodman

Contraty to the inage that may have formed in your mind upon reading the title above, this month's installment deads not with geneology but with determining the roots of an equation (at what points the function equals zerol. This is one of the oldest problems in mathentalics. White there is no one method that always produces correct results, there are several popular methods that eventually solve equations to a reasonable degree. In this arlicle l'll discuss just one of these methods and use graphics to demonstrate the results.

The Newton/Raphson method of determining roots starts with an approximation (or guess) of the conect answer and keeps applying an iteration formula to the original value to produce new approximations. These new values will either approach one of the roots, bound off to infinity or oscillate between two values. (A computer program can include checks to weed out the last two cases.) The fommala simply states that a better value is equal to the previous value. minus the function divided by it's derivative. (The derivative of $A r^{n}$ is $n A r^{n}$; for exanuple, the derivative of $x^{2}$ is $2 x$.)

Let's try a quick example and solve the equation $x^{2}-2=0$ using an approximation of 1 for an answer. The method says that a better guess is $x^{-}\left(x^{2}-2\right) / 2 x$ or, rearranging tenns $\left(r^{2}+2\right) / 2 x$. Trying our guess of 1 yields a new value of 1.5 . Using this value in the same equation we get a better value of 1.42; substituting again produces 1.414. Each successive step gets us closer to the answer. So when do we stop?

At the beginning of any program for determining roots, you need to defiue a tolerance value. When the absolute difference between two successive results is less than the tolerance, stop; that's close euough to the answer.

Now suppose we had used -1 as our guess. This time the results would approach -1.414. As your equation gets more complicated you can'l predict what intilial value will lead to which root. How many times you want to keep iterating is up to you I stop after 50 times since most values have reached a root by then (except for the ones that oscillate). And since division is involved, we'll always thave to ensure the demoninator (the derivative) is never zero.

## On With the Program

I decided to show the results of root detemmination graphically based on how long it takes a value to reach a root. Since my program uses FMODE 4 with only two colors, I have it plot a point only when it reaches a root and the iteration count is even. This gives the illusion of a contour map. The BAStC progran shown in Listing 1 is a shot demonstration that graphs the roots of the equation $x^{2}-255 x+14450$. When you rur it, you'll see that some values produce a root very quickly while others take much longer. But that's just a onedimensional graph. Howcan we use ay axis and get a two-dimensional contout map?

In previous articles in which we dis
cursed the Mandelbrot and Julia sels, we solved this prublem using complex numbers; because they're two-dimensional, they fitright into our root-solving equation. (Try to solve $x^{2}+1=$ ( using our present method!)

A complex number $Z$ is made up of a real part $x$ and an imayinary part yi ( $i$ represents the square toot of -1 ). Now let's try to solve $Z^{2}+2=0$ with a guess of $x=1$ and $y i=1$. Our better gucss for $Z$ will be $\left(Z^{2}-2\right) / 2 Z$. Since $Z=x+y i$, this reduces to $\left(\left(x^{2}-y^{2}-2\right)+2 x y i\right) /$ ( $2 x+2 y i$ ), a complex number divided by another complex number. To save you cime, a complex number $\mathrm{A}+\mathrm{B} i / \mathrm{C}+\mathrm{D} i$ results in a new real number of the forn $(A C+B D) /$ $(C C+D D)$ and a new imaginary number of ( $(\mathbf{B C}-\mathrm{AD}) /\left(\mathrm{CC}^{2}+\mathrm{DD}\right)$

This division gives us a new real number ( $\mathrm{RR}=0$ ) and a new imaginary number ( $\mathrm{I}=1$ ) which should be closer to the correct solution. We have to compare the differences between the old and new rea/ numbers and the old and new imaginary numbers. If each is less than the tolerance $\{$ I use . OOO1) then $Z_{\text {nex }}$ is a root of the equation. Using these new values, a beller result is $\mathrm{KR}=0$ and II $=1.5 . \mathrm{RR}$ will continuc to equal zero while IT will approach a root.

To graphically demonstrate this pracedure, the program checks all the values between, for example, -1 and +1 in the real ( $x$ ) direction and -1 and +1 in the imaginary (y) direction. Each poiut is be iterated up to 50 times. Whenever the parts of a $Z_{\text {tew }}$ are almost the same as the $Z_{\text {old }}$, the point is set if the iteration count is even. The machinelanguage program shown in Listing 3 carries this out using a few shor-cuts, which are explained in the source code. After you ve entered the assembly-language listing, save it using W00TS.ASH and assemble it using A ROOTS. BIN/NS/WE.

The basic program shown in Listing 2 reads your equation and pokes the necessary values into the correct locations. Save this program as roots. bas. Since the program car graph up to lifit-degree aquations, be sure to fill in the blank coefficients with zeros. Follow the six coefficients with the starting $x$ coordinate, the total $x$ distance, the starting y coordinate and the total $y$ distance. The program asks if you want a small ( $64-b y-(64)$, medium ( $128-b y-128$ ) or large (255-by-191) display.

In DATA statements, I'we included some equations you might try. Notice that I used the MKN\$ () command instead of VARPTR() in this way, we don't have to define vari. ables at the beginning of the program.

Don't look for any great speed in this type of program; with up to 50 iterations per point and over 49,000 points, it takes a while to draw. I would put the high-speed poke in Line 220 and the normal-speed poke at the end of Line 230 . Use the smaller (faster) display first to find an equation you like, then use the medium or large setting to increase it. You can zoom in on a portion by changing the $x$ and $y$ locations and dis-
(Continued)

Subscribe to these convenient services and receive each month s programs in a ready-torun form. No more long ledious hours wasted typing! No more red eyes and sore fingers! All you do is load and run. using the current issue of THE RAINBOW as documentation.

OS-9 programs are available too! One side of the RAINBOW ON DISK is tormatted for the 0s-9 operating system ( $05-9$ programs cannot be put on tape) so you can get all the great programs in the magazine.

A one-year subscription to THE RAINBOW and RAINBOW ON TAPE is only $\$ 91$ in the U.S., $\$ 108$ in Canada. $\$ 153$ foreign surlace rate and $\$ 188$ foreign airmail.

A one-year subscription to THE RAINBOW and RAINBOW ON DISK is only $\$ 115$ in the U.S., $\$ 138$ in Canada, $\$ 183$ foreign surface rate and $\$ 218$ foreign armail. U.S. curreney only. Back issues of both RAINBOW ON TAPE and RAINBOW ON DISK are aiso available! (see our back issue ad in this issue)

RAINBOW ON TAPE back issues are available beginning with the April 1982 issue. A single copy of RAINBOW ON TAPE is $\$ 10$ within the U.S., $\$ 12$ in all ather countries. The annual subscription for RAINBOW ON TAPE is $\$ 80$ within the U.S.; $\$ 90$ in Canada; and $\$ 105$ for all other countries. U.S. currency only.

RAINGOW ON DISK back issues are available beginning with the October 1986 issue. A single copy of RAINBOW ONDISK is $\$ 12$ within the U.S., $\$ 14$ in Canada, $\$ 16$ in allother countries The anmual subscription for RAINBOW ON D:SK is 599 within the U.S.; $\$ 115$ in Canada; and $\$ 130$ for all other countries. U.S. currency only.

## DELPHI-The Sp per hour online solution!

DELPHI's 20/20 Advantage Plan sets the standard for online value: 20 hours for only $\$ 20$, for all the services you want!

- Thousands of files to download.
- Chat lines with hundreds of participants.
- Worldwide e-mail.
- Hobby and computer support groups.
- Multi-player games.
- Local access numbers in over 600 cities and towns.

## Trial Offer: 5hours for \$5!

Try DELPHI at $\$ 1$ per hour. Join today and get 5 hours of evening and weekend access for only $\$ 5$. If you're not satisfied, simply cancel your account before the end of the calendar month with no further obligation. Keep your account active and you'll automatically be enrolled in the 20/20 plan for the next month.

1. Via modem, dial 1-800-365-4636.
2. When connected, press RETURN once or twice.
3. At Password, enter RB55

Questions? Call 1-800-695-4005.
Rates apply for cvening and weekend access from within the mainland US. There is a one-time enrollment fee of $\$ 19$ when you join the $20 / 20$ Advantage Plan, Further details are provided during the online registration.

DELPHI is a service of General Videotex Corporation 1030 Massachusetts Avenue Cambridge. MA 02138-5302

Feature Program

## Offers Functional Snapshots

Have you ever been doing your math homework and found yourself thinking, "If only I could see a graph of that equation...?"So you pull out some graph paper and get to work - whew! GraphIt is a CoCo 3 program that takes care of the tedious part for you. Graphit can plot virtually any function in terms of $x$ and $y$ in which $y$ has been "solved for." (Such a function is in the form $y=f(x)$.)

Enter the program as listed, then save it to tape or disk before running it. As written, Graphlt is designed for use with an RGB monitor. The display colors may be different when the program is used with a color composite monitor. When you enter RUN, you'll see the title screen and be prompted to choose whether you want the graph drawn using vectors or points only. If you press $P$, integral solutions to the function are plotted. Selecting the Vector option results in a graph using the straightest possible lines between consecutive solutions, giving an estimation of how the non-integral solutions would appear. This may distort the resulting graph in some cases but can be very useful at times.

At the second prompt you are asked whether or not you want a background grid. If you press Y, a 10 -by-10-pixel grid is drawn in pale green. Generally such a background is helpful as it puts the graph in a frame of reference. In conjunction with the Points Only option, however, it may be a source of eyestrain. In either case, the $x$ and $y$ axes are drawn in black at the center of the
screen. The graph of the function appears in red.

You may find it helpful to graph the funtion using both vectors and points, and with and without the grid. Press ENTER after the graph is drawn to return to the title screen, at which point you can graph the function again using different selections.

The function to be graphed is stored in Line 650. You can modify this line to graph nearly any equation. The allowable range ( $x$ values) is -160 through 160 , and the domain ( $y$ values) is -96 through 96. Each pixel represents one integral increment on the coordinate plane.
I've included several functions you might want to use for experimenting with Graphlt (see Figure 1). When entering an equation, always remember to use an asterisk (*) for multiplication, a slash ( $/$ ) for division and an up arrow to raise $x$ to a power. Experiment with algebraic equations such as lines ( $Y-M * X+B$ ), parabolas ( $Y=A * X^{\wedge} 2+B * X+C$ ) and trigonometric functions (SIN, COS and TAN).

Rick St. John began writing programs for the Color Computer when he was in the third grade. He is currently a junior at Stanford University and is majoring in political science. Rick can be contacted at 2131 Glacier Lane, Santa Maria, CA 93455. Please include an SASE when requesting a reply.

Merging Shell
I would like to know how I can modify the modules merged with shell. I would like to replace mdi r and procs with di rm and proc. I have tried to merge shell and those two modules into another file, after renaming it to shel 1 and deleting the original she 11 file. But when I reboot OS-9, mdir and procs are still there.

Alain Pilon (APILON)
Brossard, Quebec
Canada
First you need access to the save command, which is included with the OS-9 Development System and also with Multi-Vue. To retrieve save from the Multi-Vue package, insert Disk 2 and load pmpts from the CMOS directory, then insert

your boot disk and type save /dd/cmds/ save; attr /dd/cmds/save pe pw pre w r. Altematively, you can download a version of save (written by Kevin Darling) from either Delphi or CompuServe. If none of these options suit your fancy, enter the bsave.b09 program shown in Listing 1. Now boot OS-9, turn on the printer, and enter

## ident -s /dd/cmds/shell >/p

This gives you a list of all the modules (programs) currently merged with shell. We suggest you create a temporary working directory to prevent the possibility of overwriting any files, so type:

> makdir /dd/temp
> chd /dd/temp

At this point you could save each module to a disk one at a time and then merge all the modules, although it's easier (and saves keystrokes) to let save do most of the grunt work for you. The general technique is to

save the commands in small groups on disk, and then to merge all of the temporary files together. In your case you want to replace mdir and procs with dirm and proc, so begin by loading dirm and proc:

## load dirm <br> load proc

Now save the first group on disk by typing:

$$
\text { save shell. } 1 \text { shell attr cls ... }
$$

where the ellipsis (...) represents any other coumands in your list. Note that shell must be the first module in the file, so it is included first in the list. You probably won't be able to fit all the modules on oue command line, which is why we saved the first group to the file named she11.1. You can then save the second group of modules by typing:
save shell. 2 merge proc rename.
If you still aren't able to get all modules in

two groups, continue using a third, fourth or however many it takes. Once all of the modules are saved, merge the resultaut files and set the attributes:
merge shell. 1 shell.2 >shell
attr shell pe pw pr ew r
Now you can copy the new shell file to your CMDS directory and reboot to make the changes active. Before doing this, however, we suggest first running ident to make sure the file is clean (all good CRCs and module headers). If you get any errors from ident, check the modules in memory to make sure they are clean, then start from seratch. Just to be extra safe, double check the attributes of the file after you copy it to the CMDS directory.

Note that if you use bsave.b09, you must save each module individually instead of in groups. For example, the commands used with bsave would be as follows:
bsave shell
bsave cls
bsave cmp
merge shell attr cls cmp >shell.1
rename shell shell.mod
merge shell.1 shell.2 >shell
rename /dd/cmds/shell shell.bak
copy shell/dd/cmds/shell
Since most of the modules are also available as separate files on disk, you may be able to merge them from disk rather than save them all first.

We send a big thanks to Randy Wilson (RANDYKWILSON) for providing bsave. When we asked on Delphi for ways OS-9 users could get a save command without having to buy the Development System, Randy mentioned the Multi-Vue trick, then quickly wrote bsave and offered it to us. While the program doesn't support saving of multiple modules in one file, it is extremely well-written and worthy of study by BASIC09 programmers. This, folks, is what the CoCo Community is all about.

## Watch out for the BLOB

I am having trouble formatting disks with OS-9 Level II - 1 intermittently encounter Read errors (Error 244) during the format process. Some days I can format three or four disks with no problem, then the next disk bombs. On other days, my first attempt fails. To make matters worse, when I finally get a disk formatted and try to copy a file to it from my hard drive, the system gives me a write-verification error. Of course this, too, happens intermittently. Please help me before I go crazy.

Vic Roberts
Raleigh, North Carolina
We recently encountered similar difficulties with one of our CoCo 3 systems here, and we traced the problem to the infamous BLOB (boot-list order bug). According to Chris Burke of Burke \& Burke, there are (at least) two theories about BLOB problems, the most prevalent of which is that certain device-driver and -descriptor modules need to be grouped and should reside just after an even 8 K boundary after loading from the 0 S9Boot file.

Start OS-9 with the boot disk you ordinarily use. After you get to the OS9: prompt, enter mdir e to get a complete module directory. We suspect you'll find the disk modules (RBF, CC3Disk, d0, d1, your harddisk driver, ho and dd) spread apart and/or that they cross an 8 K boundary ( $\$ 2000$, $\$ 4000, \$ 6000$, etc.).
To correct the problem, try using a program like EZGen (from Burke \& Burke) or KwikGen (from Gale Force Enterprises) to alter the order of the modules in the 0S9Boot file. Because we had just received the program for review and wanted to give it a run for its money, we used KwikGen (reviewed August 1992, Page 6). We first grouped the modules in the following order:

## RBF

CC3Disk
d0
d1
BBFHdisk
ho
dd
Once the modules were grouped, we used KwikGen's Address function and determined how to rearrange other modules so that the first disk module (RBF) would load into memory just after an even 8 K boundary. Finally, we wrote the modified 0S9Boot file to disk. We have not had a problem since.

To use EZGen, you would follow a similar procedure, though to determine where the modules are loading, you'll have to reboot with the modified disk and check the addresses with ndir e again. You may have to repeat this process several times before you get RBF properly positioned.

One final word of advice: Before you go about patching, boot the system with a copy of the original system disk from Tandy. Otherwise you take the chance of repeatedly encountering the same frustrating Write errors you are trying to eliminate.

## Obtaining

Telecommunications Packages I'm working on trying to use OS-9 and also learning BASIC09. I have been subscribing to THE RAINBOW for a number of years, and I keep reading about all the information a person can get through the OS-9 SIG on Delphi. The question I have is how can a person acquire a good telecommunications program without having to spend a good deal of money? There are many good programs for Disk BASIC, but I haven't seen any in the same price range for OS-9. I'm talking about shareware programs. Please let me know, if you can, where I can order a program of this sort. Thank you very much for the OS-9 Hotline.

Eddie G. Wilson
Galax, Virginia
If you are willing to pay for quality software, you can purchase $K B C o m$ from CoCo PRO! (313-482-8128). $K B C o m$ is one of the best terminal programs ever written for OS-9, and its VT100 emulation is exceptional (even better than most terminal programs available for MS-DOS-based systems). If you don't want to pay iapterobior thosoftwaz Supercomm is included on the November 1991 rainBOW ON DISK, which is available in backissue form.

ค

In the July 1992 installment of "OS-9 Hotline" (Page 17), we published a modpatch script designed to set up 40 -track drives under OS-9LevelII. Unfortunately we inadvertently swapped the old-byte and new-byte parameters for the step-rate change in this script. The three lines that read

$$
\text { c } 140300
$$

should be changed to

$$
\text { c } 1400 \quad 03
$$

We're sorry forthe inconvenience, and we hope our mistake didn't cause too much confusion.

We should also note that the offset ( $\$ 14$ ) for the step-rate value is the same for all floppy-disk descriptors. You should be able to use this line to alter the step rate for any drive capable of stepping at 6 ms .

##  <br> friono <br> 

Energy is everything; your home world depends on it. However someone or something is siowly siphoning it away. As your worid's champion, you must climb into the experimental Power Tank to challenge this nemesis and his minions. Your key lies with the ability to teleport solid mass. Use this to manipulate and explore the endless stronghold of the enemy. and to exploit the free-floating DUPES (Dense Units of Photon Energy) to destroy the menacing Plasma Droids. Be cautious, though; those DUPES can be deadly, too! Photon, a fantastic new arcade game for your Coco3, contains spectacular $320 \times 200$ resolution, 16 color graphics, ultra-smooth 60 Hz animation, and loads of real-time music and sound effects. It will send your mind racing over endless possibilities, requiring quick decisions and reactions. Quite simply. Photon is incredibly addictive: it will deliver hours of excitement. Will you become your world's greatest hero, or just another
energy slave? Req. 128 K CoCo 3 energy slave?
and disk drive.

GrafExpress 2.0 is a complete graphics and music programming en-
viranment. From the beoirner to the accomulished urolessiunal, your viranment. From the beginner to the accomplished professional, you
can use Grafexpress to create lightning fast arcade games, graphic applications and utilities, and windowing mu timedia demonstrations! The Gratexpress package includes two increaible systems. graphio resolutions (from $128 \times 192$ to $320 \times 225$ ). GrafExpress 256 of graphie resolutione (from 6 resoutions (from $128 \times 192$ to $160 \times 225$ on a composite monitor) in an astounding 256 colors! Ever see a Coco do that before? Both systems include standard graphics commands (CIRCLE, FILL, etc.) that blow away the competition. For example, the 80 X command peaks out at over 2 MegaPixels/second; that's 300 times faster than BASIC' 255 separate sprites of up to $100 \times 100$ pixels each are supported with window clipping and high res pixel level collision check ing. The 8 -octave $/ 4$-voice music synthesizer has independent envelope, waveform, and volume controls, a $7+\mathrm{KHz}$ sampling rate, and much more. Other teatures include text/graphics mixing, different font sizes, fast window copying and scrolling, picture save/load, easy implementation from both BASIC and assembly language, multiple screen animation, and support for $128 \mathrm{~K} / 512 \mathrm{~K}$, double speed, and the high-res joystick interface. The package also contains support programs that are worth the purchase price of GratExpress alone! These include an introductory demo, a picture editor, a waveform editor, and an art program that supports 256 colors! GrafExpress also comes with a 50 page manual that fully expiains all of its increditite teatures. if you do any graphics programming or simply want to see what your little COCo is capable of. GrafExpress is a must! Req. 128 K CoCo 3 and disk drive.
