

Product Review: A C compiler for RS-DOS on Page 6.

## Feature Program

## A Database for OS-9 Files

by Philip G. Scherer

fter you accumulate many OS-9 programs, it's pretty easy to forget what some of them do. It's also inconvenient to search disk after disk, looking for a specific file or program you know is stored somewhere. DBOS9 is a database designed to make such things simpler by allowing you to store the names and descriptions of your OS-9 files and programs in a central location.

For operation, $D B O S 9$ requires a CoCo 3,OS-9 Level II, at least one disk drive, and

DBOS9 is a database designed to make such things simpler by allowing you to store the names and descriptions of your OS-9 files and programs in a central location.
the OS-9 modules del and copy. In addition, if you plan to enter the listings as printed here, you'll need a C compiler and the CGFX library written by Mike Sweet. (This library is available in the OS9 Online sig on Delphi. Mike's username is DODGECOLT.) Alternatively, the compiled, ready-to-run program is on the April 1993 RAINBOW ON DISK.

## Up 'n' Running

Before you start DBOS9, you need to give it a place to store the information you enter. Create a new subdirectory named BASE9 in the root directory of your /dd
device. (Those who are using the OS-9 BBS database from the Octoberissue don't need to do this; this database uses the same data directory as that one.) To do this, simply enter makdir/dd/BASE9 at the OS9 prompt.

With the BASE9 data directory in place, make sure the executable program (dbos9) is in your / dd/CMDS directory, along with the OS-9 del and copy commands. Also make sure dbos 9 's execute attributes are set. If not, you can accomplish this by entering attr $/ \mathrm{dd} / \mathrm{cmds} / \mathrm{dbos} 9$ e pe at the OS-9 prompt.
Toexecute the program, just enter dbos 9 . The first thing the program does is look for the database file, named 059 , in the / dd/ BASE9 directory. It won't find this file the first time it is executed, so it creates the file automatically. DBOSS also creates a data-base-keyword file, named keyword.dat, the first time it is executed.

Once $D B O S 9$ ascertains these files are in place in the BASE9 directory, the main database menu appears on the screen. This menu provides four options and is "hotkeyed," which means that you don't have to press ENTER aftermaking a selection. The Search menu, which we'll discuss in a moment, works the same way. Some of the stand-alone entries at program prompts, however, do require that you pressENTER.

## Entering Data

To enter data for a single record (information about a specific file or program) in the DBOS9 database, select Option 2 (Enter) from the main menu. In the upper-left corner of the screen you'll see a box with the available keywords. If the program or file for which you are entering data fits one of these keywords, simply type the appropriate keyword number and press ENTER. If none of the keywords on the list seem appropriate, or if you have not yet entered any keywords, press the correct number for the New Kcyword option that appears on the list, then enter the new keyword.

DBOS9 keywords may be up to 13 characters in length and may include spaces. It

Database continued on Page 10.

Feature Program

- wrote Financial Statement as a means of tracking personal income and expenses. In addition, the "spreadsheet" printed by the program enables ine to quickly determine my net worth. Financial Statement is designed to work on any CoCo with at least 16 K and Extended basic. To use it, first enter the program listing and save it to tape or disk, then run it.

When you run Financial Statement, you are askedto make sure your printer is online. This is important, as the program prints data as it is entered, allowing for an unlimited number of entries. When prompted, enter the current date. After this, the program's main menu appears.

To enter data, first select from the main
menu the type of entry you are making (weekly, monthly or yearly income or expense). You are then asked for a short description of the item and the amount for the specified period. After you have entered this data, the printer immediately prints it. Make sure you enter all sources of regular income, as well as all regular and anticipated expenses (bills go here).

Option 7 on the main menu allows you to enter standing assets. For instance, if you have an IRA or perhaps a savings account, the current balance should beentered using this option. Any item that contributes to your net worth is considered an asset.

Net Worth continued on Page 7.

## Letters to THE RAINBOW

## Taking Data to Another OS

Editor:
Is it possible to download a CoCo 3 disk to a PC-compatible, and is there a program to do this?

Wayne A. Johnson
Romit 2
Thamesford, ON NOM 2MO Canada

Sure. A number of utilities have been developed over the years for transferring datafrom the CoCo toMS-DOS computers. While most of the commercial products are nolonger available, several shareware and public domain offerings have been uploaded toonline information services such as Detphi and CompuServe. Also, the June and July 1986 issues of THE RAINBOW contain programs by Marty Goodman that are designed to handle the transfer.

Another means of transfening data is to use a mull-nodent cable bemeen the CoCo serial port and a seriul port on the $P C$ compatible. Then use communications software on each end, and transfer the file by uploading from the CoCo and downhoding with the MS-DOS machine.

Regardless of the route you follow, remember that in most cases CoCo programs cannot be executed on the PC-compatible. The biggest exception to this is BASFC programs, which con be edited to work with the PC's specific flavor of BASIC, whether it is GW-BASIC or QAASK. Still, such programs need to be saved in ASCII format on the CoCo (before the transfer) in order to be decipherable by the $P C$.

## PMODE4 Screen Dumps

## Editor:

I have a CoCo 3 with a CM-8 monitor, two FD-502 diskdrives and aStar Microrics NX-1001 printer. I got involved with the Coco about three years ago and have taught myself some Basic programming, mostly with help from the raingow. I don't have a modem, sol don't have access to Delphi. I copy most of the programs from the magazine and learn from them.

Looking through back issues. I came across your PMODE4 screen dump (May 1992) and typed it in. I had some trouble at first, but after I changed the DIP switches, it worked fine. There is one thing that I don't understund: why dees it print an " $x$ " at the beginning of each row?

Calvin Wilcox
6626 Edgemoor Avenue
Solon, OH 44139
As explained in the article, two different programsforproducing screen dumpswere presented. One is designed to work with Radio Shack printers in the Tandy mode, and the other is meant for use with IBM/ Epson-compatible printers. The Star NXIOOI falls into the latter category. However, there may be some minor differences between the IBM/Epson-compatible and
the NX-100I control-code sets. Since most printers produce a garbage character when they encounter a control code they don't understand, we bet this is where the problem lies. Carefully check the assembly-language listing for the control codes it uses, and compare these with the appropriate codes in your printer manual.

## A Ham in Need, Indeed

Editor:
I have a CoCo 2 for which I want to get amateur-radio and packet software, and Morse-code prograhs. I am also looking for a disk drive and a printer for this CaCo .
On a related note, I have a CW/RTTY card that fits into the CoCo ROM slot. The cable has come unsoldered on this untit, and I don't have a wiring diagram to help me put it back together. The carridge was made by Kantronics. Can anyone help me with this?

Tony Byrtem
2002 2nd Avenue $S$.
If. Dodge, IA 50501
We imagine several CoCousers are still into amalew radio Perhaps another reader can point you in the right directions.

## Laoking for the Hershey Font

 Editor:I am looking for a copy of the publicdomain Hershey font for use with William Barden's utilities published in the March 1988 issue of THE RALVBOW. I have written Mr . Barden, but he has been unable to provide me with a copy of the font. If one of your readers can provide me with this font set or tell me where to get it, please write to me at the address below.

Trevor Boehm
77 Inwood Crescent
Winnipeg, MB R2Y /A2
Canada

## Wants to Save Screens

Editor:
Is there a program (other than one in machine-language) for saving the screen? I'd like one tike that mentioned on Page 147 of the March 1987 issue of the raingow.

Denis Benjamin Marcil
222 Lomas
Sherbrooke, PQ JlJ 2R3
Canada
The program you noted in your letter oripinally was bundled with a complete printerpackage by Dayton Associates (9644 QuailwoodTrail, Spring Valley, OH 45370 , 513-885-5099). For other screen-printing software, see the May 1992 issue of The RANBOW.

## Sailing Off to C

Editor:
I've been reverse engineering the OS-9 C compiler (6809) library into its original C source code. I don't know how close my source looks to Microware's original, but it
compiles into the same object code, and that's good enough. I recently discovered that this compiler and the 6 .asm macro assembler are themselves writlen in C , and I've considered reverse engincering the C source for them also. However, before I start. I was curious if anyoue has already done all the work?

To be honest, it isn't so much the desite to have the original C source for the cornpiler, assembler and linkeras it is simply to have a version in souree form that I can custornize. I've ported a Srrall-C (a subsel of K\&RC) compiler, but itisn't very good. The only full C compiler I know of is the GNU C compiler, which is far too big. Does anyone know of any C compiler (any processor - I'll port it) or a macro 6809 assembler in source form?

Carey Bloodworth
1601 North Hills Blvd.
Van Buren, AR 72956

## Building a New System

## Editor:

I have just gorten back into the CoCo world and have managed to find a CoCo 3 and an FD-502 disk drive. I have also been given a Tandy printer, but it's a parallel printer. Can I use Tandy's serial-toparallel port couverter (Cat. No. 26-2829) on a CoCo 3? I also ueed a Multi-Pak Interface. Can you tell me where I can find one.

Marcus Springer Iol S. Central
Connersville, IN 4733I
You should able to use Tandy's seriall parallel converter, hut you' ll have to build a special cable to ga between the CoCo's 4-pin serial port and the converter. A better solution would be to get an coplverter designed specificalty for the CoCo. Both Owl-Ware (see the ad an the back cover of this issue) and Dayton Assoctiates (see our response to Denis Marcil's letter in this issue) offer such devices.

The Multi-Pak Interface was hard to find even before Tandy officially discontinues it. After that time, the MPI became impossible to find. At this point. hope another reader has one he'd be willing to part with.

THE RAINBOW welcomes letters to the editor. Mail should be addressed to: Letters to Rainbow, The Falsoft Building, 9509 U.S. Hwy 42, P.O. Box 385, Prospect, KY 40059. Letters should include the writer's full name and address. Letters may be edited for clarity or to conserve space.

Letters to the editor may also be sent to us through our Delphi CoCoSIG. From the CoCaSIG> prompt, enter RAI to get to the Rainbow Magazine Services area of the SIG. At the RAINBOW> prompt, enter LET to reach the LETTERS $>$ prompt, then select Letters for Publication. Be sure to include your complete name and address.

# Be a computer programmer! 

 Only NRI gives you hands-on training with the latest programming tools:
## - A 486sx computer with 80 meg hard drive $\quad$ Windows - Visual Basic $\begin{aligned} \text { ■ Power C } \\ \text { ■ QBasic } \\ \text { m MS-DOS }\end{aligned}$

 ■ And much more!0nly NRI at-home training gives you real-world programming skills in three in-demand languages: QBasic, $C$, and Visual Basic, today's hot new language designed for writing popular

Windows applications. Best of all, you get hands-on training with a powerful new 486sx-based computer system, complete with 80 meg hard drive, Windows, and professional programming software you keep!

NRI, the leader in at-home computer training, shows you how
to take advantage of today's newest programming opportunities Get in on the ground floor of one of today's fastest-growing career fields: computer programming. The Bureau of Labor Statistics forecasts that job opportunities for programmers will increase much faster than average over the next 10 years, with as many as 400,000 new jobs opening up by 2005.

And the fastest-growing segment of programming jobs will be PC programming, fueled by the phenomenal popularity of Windows, the efficient power of C , and the ascent of exciting new languages like QBasic and Visual Basic.

Now, with NRI at-home training, you can get the new skills you need to build a toppaying career - even a full- or part-time business of your own - in this high-growth, high-opportunity field.
 course that includes a powerful

486sx-based computer, 80 meg hard drive, Windows, Visual Basic, and more all yours to kcep! Right from the start, NRI gets you actively involved in the challenge of real-world programming. Step by step, you learn to create the kinds of full-featured, powerful programs today's employers and clients

demand...including programs designed for use in a Windows environment!

Only NRI gives you first-hand programming experience with a state-of-the-art 486sx mini-tower computer system, complete with hard disk drive, a full megabyte of RAM, highdensity floppy drive, mouse, monitor, and more - all yours to train with and keep!

Plus you explore the extraordinary capabilities of three in-demand programming languages. You learn to design, code, run, debug, and document programs in QBasic, $\mathrm{C}_{t}$ and Visual Basic. Best of all, since Visual Basic is specitically designed for creating Windows applications, you learn to generate fully functioning Windows programs, complete with text boxes, command buttons, and other sophisticated graphical interface elements.

## No previous experience necessary

Train with NRI, and immediately start getting the money-making joh skills you need to be a computer programmer - no matter what your previous background.

NRI's step-by-step lessons and hands-on programming projects help you first master the design concepts used every day by successful PC programmers. Then, with the support of your experienced NRI instructor, you quickly move on to learn programming in three of today's hottest languages.

By the time you complete your course, you have a clear understanding of programming methods, langnages, and techniques..: and you're ready to handle any programming task with confidence.

## Send today for your FREE catalog

See how NRI at-home training gives you the programming know-how, the computer, and the software you need to get started in this toppaying field. Send today for your FREE catalog!

## EDDIE KUNS

## File-Transfer Protocols

For uploading and downloading, Delphi supports most of the commonly used filetransfer protocols in addition to a few relatively obscure ones. While older file-transfer protocols were designed to transfer only one file at a time, some protocols are "batch" protocols, which allow yon to transfer more than one file in a single session. Batch protocols also automatically send the filenames of the files to be transferred as well as some additional file attributes such as file size and protections.

Most modern file-transfer protocols are error-checking; they divide the file into several "blocks" that may be of either fixed or variable size. If a block is not sent correctly, the receiving end "complains" that the block arrived in error, and the block is sent again. This error checking ensures that the file is transmitted correctly even if there is noise on the communications line. As long as such a file-transfer protocol finishes sending all the blocks, the file was transferred successfully - even if errors were encouutered along the way.

While the block size used by a protocol does not affect the contents of a file, it does have an impact on the speed at which the file is transferred, especially for people who use Sprintnet or Tymnet to connect to Delphi. TheSprintnet and Tymnet networks
have a long latency, or response time. This latency varies with the time of day and current network use - both Sprintnet and Tymnet are used by many computer systems other than Delphi.

The result of network latency is that there is a definite and noticable pause between transmitted blocks. Since transfer protocols that use smaller blocks have to send a greater number of blocks, they also spend more time waiting for the network to respond between blocks. This results in increased transfer time. As an example, the Xmodem protocol uses 128 -byte blocks, while Ymodem (generally) transfers a file 1024 bytes at a time. A file that is 4096 bytes long would require four Ymodem blocks, thus having three pauses between the blocks. This same file would be sent in thirty-two blocks by Xmodem, resulting in thirty-oue pauses between blocks. The moral: Xmodem is almost always considerably slower than Ymodem when used on networks like Sprintnet and Tymnet. If you call Delphi directly, avoiding network latency, you will not notice a very large time difference between the two protocols. (Ymodem results in fewer blocks, but each block is larger and takes longer to send than an Xmodem block.)

Most transfer protocols are called "half-

## Telnet Echo Hints

Last month I described how you can use Telnet to get from Delphi to other computers. Many computer systems allow you to enter your password without it being echoed to your screen. However, if you are connected to Delphi using Sprintnet or Tyinnet, you may see your password echoed to the screen when using Telnet to connect to another computer. This happens because Sprintnet and Tymnet echo the characters to your computer - not Delphi, and not the computer to which you are connecting.

If you want Delphi itself (or the computer to which you want to connect) to echo
the characters - and you usually will want to when you use Telnet - use the /ECHO HOST command to temporarily change your echo setting. If you are unsure what your current echo setting is, enter / ECHO to find out.

Setting host echo is useful for more than invisible passwords: If you want to use a full-screen editor on the computer you are connecting to, you need to set host echo before using Telnet from Delphi. Remember that, for the same reasons, you need to select host echo if you want to use Delphi's full-screen editors

## Uploads At a Glance

In the OS9 Online Applications database, Mike Guzzi (MIKE GUZZI) released cat 1, a program that allows you to create catalogs for OS-9 Profile. He also uploaded a utility that works with catl to catalog .GIF files. Michael Dalene (MDALENE) contributed zeroadd to solve a problem he encountered with cat 1 .

In the System Modules database, Michael Graffam (ILLUSIONIST) released new window descriptors for those who want to use more windows than were provided by Tandy. Erich Schulman (ESCHULMAN) contributed an OS9P4 module that adds a new system call to dump the 6809's registers.

In the Programmers Den database, Ken Scales released the first version of an OSK lemninal-information library; this is useful to programmers writing or porting Cursesbased programs. terminfo, like termcaps, is a way of describing how different terminals perform various functions such as cursor positioning. If you are having trouble creating complicated C variable declara-
tions, you'll be interested in CDECL, uploaded by David Graham (NIMITZ). This program deciphers C declarations and can also create them from English descriptions.
In the OSK Applications database, Tim Kientzle (TIMKIENTZLE) released a complete OSK port of TeX (including LaTeX and $\operatorname{BibTeX}$, as well as the many other parts of the system). TeX is a typsetting system that can be used to produce high-quality output on dot-matrix and laser printers.

In the OSK System Modules database, Mark Griffith (MARKGRIFFITH) released the latest serial drivers for the MM/1. Mike Sweet (DODGECOLT) uploaded the latest version of wind 1 o for the MM/1, as well as documentation he has collected from many sources for the features supported by windi 0 .
In the CoCo SIG CoCo 3 Graphics database, Johnny Williams (DRILLMASTER) uploaded an Elvis puzzle datafile to be used with the Puzzler program. Touse this puzzle, you need PUZZLER.BAS from the COCO 3 PUZZLER group in the Games \& Graphics database.
duplex" because the sender sends one block then waits for an "I got it" from the receive before sending more blocks. However, there are two ways to avoid the delay of waiting for a response. One of the easiest methods is called windowing. A windowing protocol sends blocks even when previous blocks are not yet acknowledged by the other end. For example, WXmodem provides a fourblock window. This means if the other end has returned an "OK" for Block 32, it can send blocks $33,34,35$ and 36 withoot waiting for a response. If the communications speed is low enough, a response for Block 32 would arrive before transmitting Block 36. In this case, windowing would allow continuous transmission with no pauses. The protocol stops sending data only when several blocks of data have been sent without response from the other end.

The other method of avoiding network latency is the more-complicated streaming. Streaming protocols, such as Zmodem, continue sending data, often without requiring any acknowledgement from the other end. The transfer is stopped and data retransmitted only on a request from the receiving end.

A final important feature of file-transfer protocols is whether or not they are network transparent. A protocol that is not transparent, such as Xmodem, requires an 8 -bit connection to be able to send 8 -bit binary
files. A protocol that is (or can be set to be) transparent, such as Kermit, encodes any characters the network may be unable to transmit into multiple characters that the network can transmit. For example, many networks use the XON and XOFF characters - Control-Q and Control-S, respectively - to startand stop transmission (referred to as flow control). If you transmit a binary file that contains an XON or XOFF character across a network that uses XON/XOFF flow control, that character will be "consumed" by the network as a flow-control character with possible unexpected side effects. (Fortunately, Sprintnet and Tymnet do not use XON/XOFFflow control.) This is why Kermit and some other protocols that can encode control characters into network-transmittable characters are so important.

We've discussed some of the background for file-transfer protocols this month. Next time we'll look at how each of the common protocols works as well as when and where each should be used

Eddie Kuns is pursuing a doctorate in physics at Rutgers University. He lives in Aurora, Illinois, and works as a programmer and researcher at Fermilab. Eddie is the database manager of the OS-9 SIG and can be reached online as EDDIEKUNS.

## CoCo

 Consultations
## 64K and the "E" Board

 7 have a CoCo I with an "E" board that does not appear to be modified. The computer has a " 32 K " button on it. Is it really a 32 K computer or can it address all 64 K ? Does it need to be modified in order to address all 64 K ? How can I tell if the modification has already been done? If it hasn't, how do I fix it?Wes Ratcliff (WESRATCLIFF) Stockton, Colifornia

ACoCo 1 "D" and "E" boards must be modified before they can address all 64 K of memory the 6809 supports. (The "F", or "NC," board support 64K right out of the box, despite being labeled as 32 K units by Tandy.) The modification to the " $E$ " board, allowing access to the upper 32 K of memory, is usually pretty easy to spot - look for some bent pins on some IC chips and "odd" wires going between them. On the other hand, a few very dedicated hackers have performed this modification underneath the board in such a fashion that it is totally invisible from above. To be sure whether or not your " $E$ " board has been modified for 64 K , here's a simple test: use an ohmmeter set to the Rx10 scale to measure the resistance between Pin 5 of the 74LS138 chip (U11) and ground. If the resistance is near zero (a tenth of an ohm or less), the computer has not been modified for addressing all 64 K of memory. If the resistance is some tens or hundreds of ohms, the modification may already have been performed.

To modify an "E" board CoCo 1 to address a full 64 K of memory is a relatively simple procedure. First remove the 74LS02 chip (U29) and bend pins 4,5 and 6 so they go straight up. Solder a fine wire between Pin 6 and Pin 8, but be careful: Pin 8 remains pointing down and will be reinserted in the socket; make sure you attach the wire at the very top of Pin 8 so as not to cause interference. Now solder an 8 -inch length of wire to Pin 4 and another to Pin 5 of the 74LS02. Put a small piece of electrical tape on the metal part of the shield next to where the 74LS02 goes, preventing the bent pins from coming in contact with the wall and causing a short. Now replace the 74LS02 chip in its socket and remove the 74 LS138 chip (U11). Bend up Pin 5, then replace the chip in its socket. Trim the wires to length, then solder the wire coming from Pin 5 of the 74LS02 chip to Pin 5 of the 74LS138 chip. Also connect the wire from Pin 4 of the 74LS02 chip to TP1, a staking pin located between the 6809 chip and the 40 -pin cartridge connector, near Pin 34 of the 6809. With these modifications, the computer is capable of addressing a full 64 K .

It is worth noting that Tandy sometimes used "half-good" (known to us as "halfbad") 64 K DRAM chips in their 32 K " E "board computers. It's probably best to replace all eight 4164 DRAM chips. These chips are commonly available used for 25 to 50 cents each, and should not cost more than $\$ 1$ apiece new from a chip vendor.

## Adding Drives to the FD-502

I notice the FD-502 disk drive from Tandy has somewhat different power connectors and termination than other 51/4inch drive systems. Can you tell me how to add an extra drive to the system?

Robert Coates
Sandy Hook, Manitoba
Canada

AThe FD-502 uses power connectors that are standard not for $51 / 4$-inch drives, but for modern $31 / 2$-inch drives. Its drive termination, too, follows the convention for modern $31 / 2$-inch 1.44 -megabyte drives - the floppy drive in the FD-502 uses a soldered-in 1000 -ohm resistor for termination. If you are adding another brand of floppy drive to the FD-502 case, I sug. gest the following approach: First, cut off the existing power connector on the spare power cable, and in its place attach a $51 / 4-$ inch-style power connector. Make sure you have it wired correctly, for if you reverse the 5 - and 12 -volt lines, you will destroy the new drive. Then, on the added drive, use a terminator-resistor pack rated not at the usual 150 ohms, but at 470 or 1000 ohms. If you cannot find such a terminator pack, try adding the second drive first with its existing resistor pack in place, then without, and see which arrangement works better. Note that since most terminator resistor packs for floppy drives are simply DIP component headers with resistors across them, you may be able to build your own terminator using such a header and seven 1000 ohm resistors.

## Using An Unknown Terminal With OS-9

I picked up a "junker" dumb terminal for use with my CoCo 3 under OS-9, but I have no documentation for it and don't know how to set its DIP switches for the proper baud, parity, stop bits and so on. The terminal has two banks of DIP switches and two DB-25 connectors on its rear.

Tony Reed (TONYREED) Richford, Vermont Your best bet is to use a null-modem cable between the terminal and the RS-232 Pak on your CoCo 3 , then run a terminal program on the CoCo 3 and experiment with different switch settings on the terminal. (Your terminal may have one DB-25 port for serial communication and another for a printer. These are usually labelled as such. Make sure the cable is connected to the serial port.) When characters you type on the terminal start appearing on the CoCo 3 screen, you're on the right track.

Typically there are three to five DIP switches for setting set the baud, and one or two for setting the parity and word length for each port. By playing around with the switches and matching settings with your terminal program, you can probably puzzle out most of the switch settings. Once the
baud is determined, parity and word length can be deciphered in the same fashion. Finally, by playing with control-character sequences, you may be able to determiue some of the basic screen and cursor control functions. This will be easier if you have some general knowledge of what control codes are supported on similar terminals.

Smartwatch and the Tandy Controller How do I use a Smartwatch in the 24 pin ROM socket of a Tandy disk controller?

Rick Ulland (RICKULAND) Milwaukee, Wisconsin

AArt Flexser offered some help on this one. He suggests you plug the Smartwatch into the socket so that pins 1,2 , 27 and 28 overhang the top of the socket (put Pin 3 of the Smartwatch into the hole for Pin 1 of the 24 -pin socket). But be sure to jumper Pin 28 of the Smartwatch to Pin 26 of the Smartwatch, or to some other source of +5 volts. You can then plug your 24 -pin Tandy Disk basic ROM into the smartwatch socket, making sure that Pin 1 of the ROM chip goes into the hole for Pin 3 of the Smartwatch. (Of course this, in turn, connects to Pin 1 of the original Tandy ROM socket.)

## Killing Call Waiting

Calls coming through because of Call Waiting are interrupting my modem communications. How can I fix this without losing Call Waiting's benefits?

Charles A. Marlow (CHARLESAM) N. Massapequa, New York

AIn most areas, dialing *70 disables Call Waiting, giving you a new dial tone. In other areas, you must dial 1170. In either case, Call Waiting is disabled only for the single call in which it is used. If your modem is Hayes-compatible, you can make a call by entering the following sequence:

> AT DT *70,.,nnn-nnnn
where $n n n-n n n n$ is the phone number you want the modem to call (if required, use 1170 in place of *70). The two commas tell the Hayes-compatible modem to pause for a few seconds while waiting for Call-Waiting disable to take effect.

## Disk Controllers and Drives <br> Will the Tandy FD-502 drive system work using a 26-3029 disk control-

Robert L. Fansler, Jr. (ROBERT191) Chattanooga, Tennessee

AYes. As a matter of fact, any 51/4-inch $180 \mathrm{~K}, 360 \mathrm{~K}$ or 720 K drive will work fine with any Radio Shack controller. Note, however, that the first controller Radio Shack released (Cat. No. 26-3022) does not work with the CoCo 3. That first disk controller can be recognized by the facts that all the chips in it are socketted and that there are three adjustable potentiometers on the circuit board. Indeed, the 26-3029 controller (the second controller Tandy released) is one of the best Tandy ever made for the CoCo . Note, too, that most third-party disk controllers also work fine with most drives, though a few (such as the first controller J\&M made) also have compatibility problems with the CoCo 3 . Also, any $31 / 2$-inch 720 K drive can be used with most CoCo disk controllers. In addition, $31 / 2$-inch $1.44-$ megabyte drives can be used, but only in the 720 K mode.

Is the Hard Drive Busy?
I have a Tandon 252 10-megabyte hard drive that I am using with my CoCo3. This drive does not have a "busy" light on it, and I' d like to know how' to add one?

Steven Taulborg (TAULBORG)
Reynoldsburg, Ohio
MFM drives have one 34 -pin edge connector and one 20 -pin edge connector on them. Looking at the 34 -pin edge connector, pins 25,27, 29 and 31 are, respectively, the Drive Select 1,2,3 and 4 lines going from the MFM controller board to the hard drive. Thus, it is likely that if you had an LED powered via a transistor or one or two CMOS inverter gates (to take the load off the select line), you could use one of those select lines (probably the Drive 1 select line) as your "drive in use" LED. You'll have to play around a bit depending on whether the select line is active low or high (use a logic probe first to check this out).

Martin H. Goodman, M.D., a physician trained in anesthesiology, is a longtime electronics tinkerer and outspoken commentator - sort of the Howard Cosell of the CoCo world. On Delphi, Marty is the SIGop of the rainbow's CoCo SIG. His non-computer passions include running, mountaineering and outdoor photography. Marty lives in San Pablo, California.

## Product Review

# CoCo-C: A C Compiler for RS-DOS 

Even though Microware's $C$ compiler has been available to CaCo users for years, those who prefer the Disk-BASIC environment haven't had a reliable implementation of C for some time. Yes, there have been several "small C" contilers available through BBSs, and even a few $C$ interpreters. But a well-documented version of $C$ has been needed for Disk basic for quite a while.

CoCo-C gives the Disk Basic user the ability to write $C$ source code, then compile that code into binary programs that can be loaded from disk or cape and executed. CoCo-C isn't a complete implementation of $C$ since it supports only character and integer data types and doesn't allow for complex data types. But $\mathrm{CoCo}-\mathrm{C}$ does provide most of the environment that experienced C programmers are used to seeing.

CoCo-C is delivered on a flippy disk; the systent for CoCo 3 users is on one side, and the programs for use with the CoCo 1 and 2 are on the back. (A flippy disk has files on buth sides, but you don't need a doublesided drive - you turn the disk over.) The primary differences between the $\mathrm{CoCo}-\mathrm{C}$ systems for the CoCo 3 and the $\operatorname{CoCo} 1 / 2$ appear to be limited to the text editor and the program-initialization routines. Otherwise the files appear to be the same.

## The Software

CoCo-C includes all the tools you need to write your own programs in C. Included
for CoCo 3 users is Bob van der Poel's Ultra Editor, which is a joy to use. This is a powerful text editor, optimized for programediting, that includes such features as dual text buffers that can be opened at the sarne time, as well as commands to transfer data between them. Although it iso't a complete word proccssor, Ultra Editor comes close. Full-screen editing in 40 or $80 \mathrm{col}-$ umns and simple wo-key commands allow you to quickly prepare your C source code for the compiler. Ultra Editoratso supports macros, allowing you to customize the editing environment and perform repetitive functions easily. (This editor can also be used for other languages, such as assembly language and BASIC.)

The 32 -column line editor supplied for CoCo $1 / 2$ users is much less complex. yet it provides enough features to edit any program. Still, if you need more-powerful editing capabilities, consider using a word processor that supports straight ASCIIfites, such as Telewriter

Also included with $\mathrm{CoCo}-\mathrm{C}$ is an assembler that compiles to standard Motorolasyntax assembler code. By eliminating CoCo-specific functions, you can useCoCo$C$ on your Color Conputer to develop ROMable code for just about any 6809 based system.

Programs writter using $\mathrm{CoCo}-\mathrm{C}$ can be interfaced with programs in other languages (i.e., CoCo-C programs can be called from BASC as subroutines). At the same time, a unique interface between $\mathrm{CoCo}-\mathrm{C}$ and the

[^0]BASIC ROMs in the com putergives your C progams all of the power of BASTC; the basend function allows you to make calls to the routines in the BASIC ROMs. Using this approach, anything your version of BASIC can do (including graphics), your C program can also do. This feature could also be used to work with floating point numbers
$\mathrm{CoCo}-\mathrm{C}$ features some special functions that make it easier to work in a CoCo environment. These include commands for switching a CoCo 3 between the CoCo 3 and $\mathrm{CoCo} 1 / 2$ modes, testing whether the program is running on a CoCo 3 or an earlier Color Computer, setting up for the CoCo 3's RGB and compositevideo modes, and setting the computer for the high-speed mode.
Some special functions that are normally used by the CSTART library routine are documented and can be used to set up buffers in memory and to change the errorchecking characteristics. $\mathrm{CoCO}-\mathrm{C}$ also provides a mechanism that allows you to inser or even include asscmbler routines in your C program, giving you even more intimate control of your sysiem.
As I implied before, $\mathrm{CoCo-C}$ is a welldocumented implementation of C for Disk basic. No, it isn't C++, and it doesn't have a huge library of extras. But CoCo C gives you most of the standard $C$ functions. Besides, with bascme, the Basic ROMs themselves become a fairly extensive library of routines.

Finaily, all of the expected expressions and operators are supported, including the shift operators. Most of the normal program coutrol statements, such as $i f /$ then/el se. While/do and for work as they should. Some of the usual conversion functions do not work as expected or are not suppored because of the linuited types of data that can be handled.

## The Documentation

I was impressed with the quality of the manual supplied with CoCo-C. Since writing users manuals is my job, I have some idea what's involved in producing a good understandable manual; CoCo-C's manual appears to meet all of the criteria. You atc taken through a fogical progression from entering the source code for a program to compiling, assembling, linkitm and tinally executing that program. Each function is presented using the typical C syntax statement, then a complete description explains how the function is used, what type of data it requires and what type of data it retnrns An example of the function when used in a C language program is given to helpclarify its use. In addition, program examples in the back of the book provide step-by-step and line-by-line explanations showing you how to enter a program and what you nced to do to compile it.

Also included in the manual are complete technical specifications to help you understand how you can connect programs written in $\mathrm{CaCo}-\mathrm{C}$ to other types of programs as well as how CoCo-C puts your program together. This section explains how the conpiler works with C-language source code to construct the finished ex ecutable program.

## Feature Program

## Learn to be Quik on the Keyboard

## by George and Ellen Aftamonow

Q
wh，a cute game for the CoCo3．is not onlya lot of fun，it helps you learn a little about the DRAW comm－ mand used for Color Com－ puter graphics．To get started，enter the complete listing and save it to tape or disk （before running it I．Then enter RuNe．

Once the game is started，you＊ll see eight arrows on the screen－one arrow pointing in each of the eight directions for which DRAW subcommands support direct move－ ment（see Figure 1）．One of these arrows should be flashing．

The object of Quik is to quickly press the key ihat corresponds to the direction of the thashing arrow．As soon as you do，another arrow stards flashing．Theconputer chooses． the arrows randomly，so il you press the correct key und the arrow continues flash－ ing，press that key again．This process con－
tinues for a specitic length of time（which you select after running the program but before stanting the game）．When the time is up，the number of correct responsen you made appears on the screen and you are given the option to play again．

Quik is a lot of fun to play，and the game is educational in a somewhat unique way． We hope you enjoy it，too．

George and Ellen Aftamonow＇，nwe self－ taught pragrammers beheve compurer us－ ershed another mumber crum her as budly as a pig needs a wallet．So rhey like to sit don＇n and enjoy the challenge of writing conterfaimment sofmare．They can be con－ tactedat 46 Howe Srrect，Milford，CT 16460. （203）878－3602．Please include an SASE when reguesting a reply．

## Feature Program

## One Address or Many？

## by Charles Kiedaisch

Whether or not they write letters to fricnds．most people spend at least a little time each month addressing envelopes．Not cveryone， however，gets high matks for pemmanship． And when greeting cards are in order－ especially during the holidays－writer＇s cramp becomesa problenn（usually for those who don＇t write often）．The two programs presented here can be a real help during these times．

The program shown in Listing 1．Ad－ dress，prints your return address and the recipient＇s address on just about any enve－ lope．Before you tun the program，make sure you enter your mame und uddress in limes 160 through 180．When Address is cxecuted，you are first asked to enter the recipient＇s name and address．The program then prints your return address and asks what size envelope you are using．Press 1， 2， 3 or 4 accordingly and the program procecds to print the remainder of the cnve－ lope．

Address is designed 10 accommodale four different envelope sizes：standard．long， odd－sized and small．Actudly whal hap－ pens is that the printhead is moved（using PRINT 4 2，TAB（T）$)$ to adiffctcat position based on the selected envelope size．The tab values are set up in litees $28(0,300,320$ and 330．Feel free to change these as you see fit．

Address Thu（Lisliug 2）works much like Address except that ft allows you to store data for the addresses to which you frequently send mati．In addition，you can elect to print all stored addresses or only a specific address，on the printer or to the screen only．You can also print a complete directory of all stored addresses．

Before running the program．make sure the names and addresses you want are stored． in the data lines at the end of the lising．Use the same format indicaled when you enter your data，and make sure the kast LAIA staitement starts with the word Enn．Also make sure you enter your return address in lines 620 through 640．The tab values for
different－sized errvelopes are in lintes 980 ， 1000,1020 and 1030 should you want to change them．

Some users may wonder why 1 wrote Address Two in such a fashion that it uses DATA statements instead of storing address information on disk．In the first place，using DATA statements makes the program easier to nsc with tape－based CoCosysterns．Sec－ ondly，it allows you to create several differ－ ent versions of the program．using specific groups of addresses in cach，much like separate mailing lists．This is handy when you send cards or letters to different groups of people on different occasions．And you can put the names and addresses of all your creditors（those who don＇t provide pre－ addressed envelopes，anyway）in one pro－ gramz listing．

Both Address and Address Two are de－ signed to wark with the Tandy DMP－133 in the Tandy mode．The control codes used and the lines in which they appear are shown in Figure 1.

In an effort to help the postal scrvice by printing clearly，we only help ourselves． increasing the chance that out mail will gel where it＇s supposed to go．I believe you＇ll find Address and Address Two to be useful additions to your library．

Charles Kiedaisch is a retired tool－and－ die designer who still does some indepen－ dent work and uses his Coch 3 to ereale master drawings．He enjoys huilding useful programs for the Color Computer．

## Database from Page I

doesn＇t matter whether you enter lower－or uppercase characters－all keywords are automatically stored in uppercase．The pro－ gram allows up to a total of 15 keywords by which you can categorize your programs and files．If，during the course of operation，

> If the filename you enter for a record already exists in the database，DBOS9 will not store that record．The program searches the data－ base before any records are written to ensure that there are no duplicates．

you delete all database records associated with a specific keyword，that keyword is automatically removed from the list．

After you select an existing keyword（or create a new one）for the new record，you are asked to enter the OS－9 filename for the file or program for which you are recording information．$D B O S 9$ accepts filenames up to 24 characters in length．Again，all filenames are automatically switched to all uppercase characters．

The next prompt allows you to enter up to three text lines of up to 49 characters each．These lines can be used to describe the program or file，or to remind you of
preliminary operating instructions for that program．

Finally you are asked for the disk iden－ tifier．This is a special place for whatever identifying names you use for the disks in your library．After this，you are given the option of storing the record in the database or returning to the main menu without stor－ ing the information．

It is important to note that if the filename you enter for a record already exists in the database，$D B O S 9$ will not store that record． The program searches the database before any records are written to ensure that there are no duplicates．

## Searching for Records

To search DBOS9＇s os 9 database file， press 1 at the main menu．A submenu ap－ pears with the following options：1）Key－ word Scarch，2）Name Scarch，3）First Letter Search，4）List Names and 5）Main Menn．The fnoction performed hy each of these entries is fairly obvious when you are running the program，so we＇ll take only a brief look at them here：

Option 1 －To search for records based on the selected keywords，press 1．After the keyword box is displayed in the upper－left corner of the screen，select the numnber for the keyword on which you want to search． DBOS 9 finds the first record categorized under the selected keyword．Subsequent records are displayed as explained below．

Option 2 －To call up the record for a specific file or program，press 2 at the Search menu．When prompted，enter the exact name of the program or file in ques－ tion．Since all filenames are converted to uppercase，it doesn＇t matter whether you

Database continued on Page 12.

The next programming language for OS－9！
Icon Basic09 is a graphical user interface（GUI）to Basic09，which will make programming easier than ever！Icon Basic09 takes an innovative approach by using graphic representations，or icons，to represent statements and keywords for writing Basic09 programs and procedures．Instead of constantly typing while writing a program，the user can simply point \＆click to choose the desired statement！

Icon Basic09 can also be very useful in studying procedures and programs written by others to learn how they operate．The package contains a full sel of icons．．．or，you may edit or create icons using the included icon editor．Icon Basic09 requires a CoCo－3 with at least 256k， mouse or joystick，and OS－9 iv 2.

## Database from Page 10

use lower－or uppercase characters when entering the filename．
Option 3 －If you are not sure of the exact spelling of a file or program＇s name， this option allows you to enter only the first character of the name．DBOS9 then finds the first record in the database for which the filename starts with the entered character． Subsequent records are displayed as ex－ plained below．

Option 4 －Use this option to see all filenames stored in DBOS9 database records．
Option 5 －This option retums you to the main DBOS9 menu．

Whenever a DBOSS recond is displayed （by options 1,2 or 3 above），an action list appears below it on the screen．Options available on this list allow you to change the displayed record，delete the record，con－ tinue to the next record（not available for recordsdisplayed usimg Option 2），write the record to disk，or rerum to the Search menu． If you choose to change the record，you must write it to disk before cxiting the screen．Otherwise，any changes made are not recorded in the database file

## For Safety＇s Sake

Thethird option onDBOS9＇s main menu is Backup．Selecting this option allows you to create a backup set of the os 9 and keyword．dat files．The default backup is performed the from／dd device to the／do device．If $/ \mathrm{d} 0$ is the $/ \mathrm{dd}$ device on your system，the backup files are written to the same disk．（These default device selections appear in the function 0 g 9 top ．c．Listing 1 ． You can change them and recompile the
source code．）
The backup files are stored using the names 0．59．bak and keyword，bak．If you later need to use these files with DBOSS you must change their names to os 9 and keyword．dat，respectively，and place them in the／dd／bASE9 directory．

DBOSO is written in Cand is made up of five functions：os 9 top．c，os 9 search．c osgenter．c，os9ch＿del． c and keyword．c，． os9top．c contains the main menu and the database－initialization operation．It also handles the data－file backup．os9search． c contains all of the search functions and uses keyword，c．os9enter，chandles the entry of new data and also uses keyword．c． os 9ch＿del contains the change and delete functions，which are called by display（） keyword．chandles all keyword manipula－ tion and contains the function display（）． which displays file data on the screen，

The program uses what is called mutual recursion during some of the operational sequences．For instance the logic might procedeas follows：os9search（）calls key word（）which calls display（）which calls change（）which calls keywort（ ．In such a scenario，keyword（）is used twice，but it is stored in memory only once．

Phil Scherer is a mechanical－design engineer for outomatic packaging and as－ sembly systems．In addition to working with OS－9 on the CoCo，his hohbies include snorkeling and horticulture．He can becon－ tacted at 6191 NW 34 Huly．，Ft．Lauder－ dule，FL 3．3309．Please include an SASE when requesting a reply．

Unsurpassed Entertainment Software For Your Color Computer

## CHECK OUT OUR NEWEST TITLES

GrafExpress 2.0
The response to this graphics and musit programuming environment has been ostounding．Now with Graffxpress 2.0 the $\mathrm{CoCo}_{0}$ community can create lightring fast arcade games， graphic applications，and windowing multimedia demos using up to 256 colors！Its grophics tookit blows away the compatition（up to 300 times faster thon BASIC）．Features include fext－grophics mixing，sprites，tollision cheeking，fost window scrolling，mutti－page animation，and easy interfacing with BASIC and assembly language．Included along with the 50 page manual are suppart programs worth the purchase price alone：an Introductory Demo，Piture Editor，Woveform Editor，and a 256 －olor Art utility．Req． 128 K min．$\$ 34.95$

## The Contras

This 512 K paramilitory combat arcade game features a 2 player cooperative mode，incredible graphics，super－smooth onimation and scroling，sizzling saund effects，ond an outstanding background music scrie．The Contras proves that the cofo can matth－or surpass－any home game system． Blow oway the enemy through multiple levels and power up with ever more destuctive weapons．The most ambilious gome ever created for the CoCo3！$\$ 34.95$

## Phofon

Photon is a proven winner．The critics ogree that it is one of the most challenging，original，and oddictive gormes ever made for the coco．This arcade game combines action and strotegy with 16 －olor，vilro－smooth onimation and loads of real－time music and sound efferts．Ovar 60 devious levals of excitement．Requires 128 K Coco $3 . \$ 34.95$
＂It is the most addicing game l＇ve ployed on the coco since Tetris．．．．Photon has the mark of a dassic game．．． My rexommendotion：Addit yourself．${ }^{n}$
－Lauren Willoughby，Rainbow magazine．

[^0]:    
    The C Compiler for the CoCo has finally arrived..

    ## $\mathrm{COCo}-\mathrm{C}$

    CoCo-C is a complete RSDOS based C development package for the Golor Computer net requiring the OS-9 Oparating Sysiem. GeCe-C consists of five main programs: a Text Editor, a C Compiler, an Assembler, and a Library Linker which are all controlled by the COCO-C Command Coortirator.

    ## Text Editor

    A fuil featured screen oriented line editor for the CoCo3 develeped by Bob van der Pool. Powertul editing and cursor cormmands with auto-indent and user defined macros make this a great editor tor writing C or assembly language programs. A less sophisticated version for the Coco 2 is also avaliable.

    ## C Compiler

    The CoCo-C Compiler is a full featured $K \& R$ style integer compiler specifically designed for RSDOS based systems. It has assembly language output, position independent code and can outpul ROM-ab:e code if desired. Added features allow you to mix C. assembly language ano BA.S|C commands within your program!

    ## Assembler

    This symbolic assambler is capable of assembing files as large es available disk space. It supports a Motorola style syntax and outputs standard binary files ready for LOADM and EXEC. Options include list file output and generation of symbol table file.

    ## Library/Linker

    The Library Linker is a utility which links the CoCo-C's $90+$ function libray with your compited binary file, creating a stand alone executable ML file

    ## Command Coordinator

    The Command Conndinator is CoCa-C's main program. Its user fiendly menu driven screen smoothly switches back and forth between the Editopr. Compler, Assembler and L nker.

    The CoCo-C Compiler package includes BOTH CoCo 2 and CoCo 3 versions of ALL the programs listed above plus MORE। Compatible w/B\&B RGBDOS

    Never before has there been an offer like this for the Color Computer Requires 64 KCOCO 2 or $128 \mathrm{~K} \operatorname{coco~} 3$

    Send check or money order to
